I always knew that, since any FCC type-acceptance, automatically covers
Part 15.

There are a lot of companies that are gonna get mad, scared, or both,
and resort to mudslinging campaigns and other assorted dirty tricks.

If someone has done this already, then you know they feel threatened.

Since QST published a review, that means the radio has the blessings of
the ARRL, which means the Big Boys are definitely going to have their
attention on things now. This also means, a lot of hams leery of buying
this radio from an "unknown" entity, may reconsider.

Universal Radio here carries the TYT radio, similar to our Wouxuns.
"rumor" has it the owner declined the Wouxuns due to the availability of
"unlock software" and has had TYT send them models set specifically for
the ham bands.

If you see the major Ham retailers selling a VERY low cost radio, you
can be sure the big boys WILL notice.

None of the UVD1P I see support 2/5 Tone SELCALL and inversion.

1750 EURO only

http://www.wouxun.com/Two-Way-Radio/KG-UVD1P.htm

No 2/5 Tone and/or Inversion listed.

Other companies (non KGUVD1[P]) may support it like the TYT etc.. but they don't go to 520 and this is the KGUVD1[P] forum.

I specifically looking for the model that was posted which lists 2/5 tone and inversion, and I've not found anything for the KGUVD1[P] that lists those as either options or features.

Not here either:

http://www.wouxun.com/Two-Way-Radio/KG-UVD1.htm

so w6krp wrote:

Where is this I've looked all over wouxun site since the post and don't see this for the KGUVD1P? ? ?

Thanks.

I can't get the price to come up at the moment. It was in Euro, not
dollars, which leads me to believe that it may even be LESS than
$179 to $189. And the website (though not a USA website) says
they have them "producto en stock". It would be interesting for
someone to take a leap of faith and personally import one.

I'm not sure which "Ed" you are referring to but THIS "Ed" is not holding out on anything - and neither is the other Ed. Neither of us can get a price nor order the radios yet. Ghees, some are hard sells around here even when we level with you.

The best I can do is "take names" and those who order first with an unknown price at this time gets the first radios out.

Can you imagine what would happen if Wouxun did a fold out ad or center fold ad in QST? It would turn ham radio equiptment in a dizzy nosedive for Kenwood, Yaesu, Icom, etc. Competition is healthy for our economy and for consumers. Let's see a price war start and who is to benefit? WE ARE!

Can you imagine what would happen if Wouxun did a fold out ad or center fold ad in QST? It would turn ham radio equiptment in a dizzy nosedive for Kenwood, Yaesu, Icom, etc. Competition is healthy for our economy and for consumers. Let's see a price war start and who is to benefit? WE ARE!

I always knew that, since any FCC type-acceptance, automatically covers Part 15.

There are a lot of companies that are gonna get mad, scared, or both, and resort to mudslinging campaigns and other assorted dirty tricks.

If someone has done this already, then you know they feel threatened.

Since QST published a review, that means the radio has the blessings of the ARRL, which means the Big Boys are definitely going to have their attention on things now. This also means, a lot of hams leery of buying this radio from an "unknown" entity, may reconsider.

Universal Radio here carries the TYT radio, similar to our Wouxuns. "rumor" has it the owner declined the Wouxuns due to the availability of "unlock software" and has had TYT send them models set specifically for the ham bands.

If you see the major Ham retailers selling a VERY low cost radio, you can be sure the big boys WILL notice.

There's 2 flavors to Part 15: Intentional Radiators, and Unintentional Radiators. If a device is an Intentional Radiator, then it's designed to transmit. Baby monitors, 49MHz walkie-talkies, radio controlled cars from the Crap Shack, etc., are all intentional radiators. They have specific power limits (x mW @ 1m) and harmonic suppression requirements depending on the frequency that they're designed to transmit in. The UNintentional radiators, usually receivers of some type, or something with a chip or crystal that might emit RF, have a maximum amount of power that they can emit as well, but it's FAR lower than the intentionals.

The "big players" are not competing with Wouxun. They are aware of Wouxun, but at the moment the big players are catering to the portion of the market that has enough money to not care about the price. They really aren't very interested in homebrewers and hams who don't have a bugdet of at least $500/year for radios.

Wouxun is only eating away at a market they currently do not serve. Further, the major players may not be very interested in serving it.

This does affect them, but not nearly as much as people are thinking it does. It will, however, kick into gear a lot of anti-competitive tactics to forestall Wouxun market acceptance.

Annoying Wouxun with FCC investigations is only the tip of the iceberg among these. I guarantee they've already got the radio and software apart and being analyzed for possible patent issues. I suspect a lot of the major players have patent cross-licensing agreements, which would put Wouxun at a severe disadvantage if they are found to be infringing on some patent or another. Even if they aren't, it's not terribly difficult to tie things up in court and prevent or delay imports, causing material damage to Wouxun's business.

It's far easier and more profitable in the long run to do this than it is to provide a lower cost, comparable radio.

While FCC and UL testing is expensive in the eyes of most consumers, it's really only $12k-$20k for intentional radiators with AC adaptors/chargers/etc. It adds up, and for a run of a few thousand radios it's significant, but it's not as if even 1% of each radio's cost is needed to cover the initial approval testing.

If they do want to compete with Wouxun, it will take them at least 2 years to respond with lower priced models. Until then they'll be telling customers that the only way to produce such a low cost unit is by using a cheap design, cheap components, cheap assembly, and cheap testing, and ultimately "You get what you pay for." They'll keep using that line right up until they sell their own radio that competes with Wouxun, and they will then state that they've had a breakthrough, were able to overcome the cost issues, and that Wouxun is still worse quality than their new inexpensive model. It's a common way to deal with this sort of competition. Regardless, it's going to take at least 2 years of strong market acceptance of the Wouxun units to really affect pricing of the major players, and chances are good they won't lower the price of their current units, what they will do is increase the features of their current units to justify their higher price, and introduce lower cost sets that don't have all the features of the Wouxun unit, but have a few features the Wouxun doesn't

have, and convince customers that those features are more useful/important/etc.

-Adam

I have seen this before part 90 is a lot more testing than part 15 and there is always some ford dealer mean mouthing the doge dealer down the road. The Wouxun is a very good rig and can be sold in the us according to the fcc. Just check there website. and the last time I looked part 97 does not require a type any thing to use a rig on the ham bands so you can use it but you cant sell it unless it type accepted. It seems that snake oil salesmen will try to sell snakes some time.

Here's a new turn of events.

I have been communicating with Wouxun over a matter they brought to my attention and asked for assistance on. It seems a competitor of theirs is suggesting to potentional customers (and actual customers) that the Wouxun is not type-accepted or FCC Certified. They were honing in on the Part15 area.

I did some research for them at their request and the KG-UIVD1P "IS" in fact certified for Part 90 AND Part 15 and no label is required. Part 15 is predominately addressed with wireless objects that offer RF unintentionally. Some gadgets might be your TV remote or garage door remote, a light dimmer switch, a toy, computer screens, etc. These devices require the tag notice applied to them. During the routine Part 90 certification process, the RF and EMF measurements are done as part of the testing and so when the Part 90 certification is awarded there is no need to place the additional Part 15 on the tag. If a radio is approved Part 90 then it automatically is approved for Part 15. I think this is unfair competition and downright lies to the public or consumer by the other competitive company or companies. Wouxun did not disclose to me the name of the other company but one can only imagine.

It is not cheap to attain certification by the FCC so when you have a radio or device that has gone through the process, you can be comfortable knowing it probably is a reputable company.

Hi friends,

Just a general business observation... more established vendors will most likely endeavor to take some action in response to the Wouxun (and other low-price Chinese manufacturer) offerings only when they deem that the Chinese manufacturers are having a material effect on their business.

And while the action that the more established manufacturers take could include lower prices, the action could also include offering new models of lower-tier radios at lower prices, rather than dropping prices of their high-end products.

Some people have this problem when the programming cable is not fully inserted in to the radio. Some cables take quite a firm push to fully seat the connector.

I disagree with this statement. While people who don't have the money
to invest in the latest/greatest, they are like a hungry mob, waiting to
pounce on expensive "last year's model" when someone who does buy
new rigs all the time to go into the "sell mode". Without a ready market
for used expensive radios, the "rich guys" can't unload last year's model,
and won't be buying this year's model. Think of it this way- would you
rather own a brand new basic Ford with zero miles on it for $20,000.00, or
would you rather own a three-year-old fancy Jaguar that has 100,000 miles
and may have hidden damage for $25,000.00? I think a wise person would
take the brand new Ford all day long.

You also have the "practical rich", who would buy a basic model in spite of
being able to afford an expensive model because, well, how do you think
they got rich in the first place? My wife gets angry with me all the
time because
I won't drive 15 miles to pick up something I need, preferring to wait
until
the next time I pass that way. The pennies I save in gas add up and buy me
something nice (radio-related) in the not-so-distant future!

Here is info from Chris Imlay, ARRL General Counsel, regarding Wouxun handheld Part 90 certification, as published in Nov. 2010 QST Magazine:
Is It Legal?

The FCC doesn't require equipment authorization for any "Amateur Radio" transmitter to be operated under Part 97, except those that incorporate scanning receivers, which require a grant of certification. If an Amateur Radio transmitter also includes frequencies allocated to other services, and if the device is intended to operate in those other services as well as the Amateur Service, then the transmitter must be certified for all non-Part 97 radio services for which it is intended to operate. The FCC uses the term "intended to operate" as being equivalent to "capable of operation."

Wouxun is able to legally market a device that operates in the bands specified and that has a scanning receiver, because it has a certification grant (for Part 90 operation) which satisfies the certification requirement with respect to the scanning receiver. It can be operated by Part 97 licensees and by Part 90 licensees in their respective frequency bands.

Wouxun US chooses to limit the frequency range of the amateur version of the device to ham bands only. Restricting the frequency range of the device to ham bands only is okay as a Class I permissive change (without recertification) as long as the means for restricting the frequency range in the amateur version of the device is not done with hardware changes and without any denigration of the characteristics of the device as reported to the FCC. Wouxun US presumably wants to make sure that Part 97 licensees do not operate the device on Part 90 channels, and vice-versa. It is good practice for them to market the ham band only version to hams, and to market the Part 90 band only version to Part 90 licensees. Good fences make good neighbors. — Chris Imlay, W3KD, ARRL General Counsel

Hi friends,

I am not concerned about "corporate greed". I am very happy about "corporate greed" (although that is a goofy term).

If you have a job that pays $25/hour, and you buy a nice handheld for $200, you are trading eight hours of work for a radio that you would not be able to build yourself with 800 hours of work.

And if you are not satisfied with the 99%+ reduction in the effort you much expend to get a fine radio, then we have what I call "consumer greed" -- the idea that somebody else is responible for providing you with your needs and wants, and that you are to be the arbiter of what is a "fair" price to pay..

Nobody has ever paid more for a radio than what that person determined it was worth... because if the asking price is more than its worth, then you just forego buying the radio.

The most dangerous kind of greed in the world -- one that is driving us to ruin -- is not corporate greed, but "consumer greed" -- the idea that the world owes us what we need and want.

David / K7DB

Well I don't think the BIG BOY'S are ever going to lower the price on there radio "why" because of corporate greed for one for to why should they when they know the consumer will pay for two and for three supply and demand so its the same as the gas prices don't get me on that subject lol but really just think about it just putting my 2 cents worth in

Hi friends,

If Wouxun were to increase advertsing, that does not mean that customers will pay for it. Effective advertising can lead a rational producer to reduce the price of his product. Although there is the additional expense of advertising, the broad reach can motivate the producer to lower the profit on each unit in return for selling many more units for more total profit.

A good model for Wouxun would be a "co-op" advertising program, where dealers get an allowance as a percentage of their purchases of radios, and that allowance can be spent to subsidize a percentage of advertising purchases by the dealers.

David / K7DB

Problem is.. if Wouxun pays for these ads, then their overhead
increases. The "big boys" crank out a lot of advertising dollars, which
we pay for every time we buy a rig. Wouxun is mostly internet and word
of mouth, which our cost is zero.

If Wouxun were to get some big ad campaign, I'm sure costs would have to
be picked up by increased equipment costs.

Now... of course... a one time deal.... :) Oh
Yeah... that would scare the big boys for sure :)

Yes.... if played right... WE surely ARE to benefit!

Dave..

We have used everything form Norton, Eset, AVG and others. Got tired of the problems they cased with system slow downs and false warnings. Finally went with Microsoft when they got their act together and provided an excellent anti virus - maleware program.. Best of all it is free and give you regular automatic updates.

We have it running on over 20 machines at various locations and never had a problem..

http://www.microsoft.com/security_essentials

And.. yes I can run the Wouxun programing software with no warnings..

Thanks a lot for posting to the group! Your software is great, it is very nice
to be able to program the radio natively under Linux!!
One question, do you think it would be possible to add the capability to edit
the saved broadcast FM radio? Unless I missed it I don't think it is possible
from the Windows software.
Also another idea would be to add support to import / export to the original tw
files (this would make it easier to share configuration files with people using
the windows software). I think someone published code to the group that can do
that from Excell, if I find some time I might have a look a it.
Thanks again for your code!!

Do you want an ARRL that tells the truth, for the furtherence of YOUR hobby and you, or an ARRL more interested in allowing it's existing advertisers a free reign to screw you for all the money they can get out of you ?

The big three are lagging far behind with their handhelds.
Soon they will be forced out the HANDHELD market and concentrate only on mobile/base rigs.

Serves them right!

here is the reply i received from Wouxun in asking them about the mobile radio that everyone has been talking about, i as well asked them if they were planning a 220 version for a mobile radio.
Hi Mark,
Good day ! Thanks for your kindly inquiry.
Here is Yoleen from Wouxun Electronics, hope you are fine.

To know more about us can kindly enter our web www.wouxun.com or our full catalogue in www.wouxun.cn/wouxun.pdf .
With
10+ years experiences in hand held professional VHF/UHF two way radios,
we gained high reputations from our clients throughout the world.
We strongly hope can also be one of your golden suppliers in China.

According to your interestes in our new Mobile radio, we are so sorry this model is still under testing.
We are in searching the marketing and pricing, as well as the specifications.
Well, if you have any ideas on this kind of information kindly share with us. Thank you for your help in advance.

By the way, it will be highly appreciated if got any further information about you or your esteemed company.

Hope this is the well beginning of our future long term business relationship.

Looking forward to hearing from you soon.

Thank you.

Yoleen
for Danny Chen

I am pleased to announce that our Wouxun KG-UVD1 group has welcomed its 1000th member with the joining of Geoff, G3TQF. Quite an achievement since its founding in 6/09.

Recognizing this milestone, Keisha and Danny Chan of Wouxun and Ed Griffin of Wouxun.us have donated a new KG-UV2D model and accessories to our 1000th member, Geoff. Many thanks to Keisha, Danny, Ed and each of you for making this little rig and our group a success.

73, Steve

Nah...

Think "Starbucks Effect".

Local coffee houses tend(ed) to cry foul whenever a Starbucks moved in. However, it turns out that Starbucks simply created more demand for a product that was available before, but with so-so demand for it (i.e. quality coffee).

Wouxun is on its best way to create a similar increase in overall ham radio equipment demand and therefore the established manufactures will most likely see an INCREASE of demand (not to mention that they just might "revive" the 1.25m band). There's only so much "Wouxun-ing" you can do and eventually you want, say, a Yaesu VX-8DR... (since it's one of the rare ones with 222MHz...)

I haven't bought anything in 10 years, but when Wouxun showed up, I decided to get back a bit more into Ham radio again.
Not to mention that it is now easier than ever to convince folks to get a tech license with hand-helds as low as $79 shipped (i.e Wouxun KG-816 single-band).
Now, hopefully the mobile rig can be priced competitively as well ($149 is my price point)

Over.
AR.

I think this could very well assist in reviving 220.  There are so few rigs
avalable for 220, that this could spark a revival. I have a 220 model for this
exact purpose.  I know someone locally with one also.
It is too early to tell.  We can hope.

Most of the Wouxon sets showing up in my area are 2M/220, but
a few have bought the 2M/440 sets. The 220 repeater here is one
of our best assets. It has range and quietness on the band that makes
it a much better choice than either 2M or 440, plus the extra wide
split makes for less desense on the repeaters. I give it five thumbs
up!

I carried my (new) Wouxon HT around all day yesterday while working
in the yard. It took no tumbles off my belt. I put a local FM talk station
on "Vice B" and the local 2M repeater on "Vice A". Every time activity
hit the 2M repeater it flawlessly changed over, missing no syllables from
any transmission. A few seconds after the repeater went silent, it
faithfully
switched back over to the FM talk station. So far, I've got NO complaints!

If you have a job that pays $25/hour, and you're hiring.. I'm available!

Realistically it's more like 20-28hrs of work for most people, assuming they even have work.

the information is certainly realistic and accurate, in my opinion.

Their research and development department has to test the radio to make sure it fits their standards.
(After all, the radio has to actually WORK) There could be several design changes to kill bugs.

Then they need to retest... and retest.. and come across the FINAL design.

Then, they really need to see what the market looks like and determine price.

THEN... they need to submit it to a testing lab that can submit the proper paperwork to get FCC approval (if you want to legally
buy and use the radio in the usa [or CE approval for Europe])

THEN they need to set up the manufacturing process.

Oh.. then develop inventory to meet suppliers....

THEN... sell.

It is all time consuming.

If you rush, then you get a poor product.

Yes... I'm as excited as everyone else :)

I have 3 ht's now and sold my Icoms.

I have 2 mobile rigs.... If Wouxun is holding up to their track revcord so far... I'll buy 2 Wouxun mobiles and sell my Icom mobiles.

Have faith :)

They do the switchover quite well. They certainly have done their research. A friend listened to broadcast and the

switch from an active ham freq was amazing...

220 needs more use and I sure hope it will happen... I have had a couple contacts from folks that have such capability.

From: David A. Behar
Topic: 3037 Message: 3060

Hi friends,

For anybody looking to work on software to read/write the TW file or read/write the radio's 8kbyte EEPROM, you might find files I posted in the files area under folder K7DB helpful. There is a memory map for the "TW" file format, and a memory map for the 8k memory space. (And of course, also a spreadsheet to edit channel parameters in a TW file, add/delete/sort channels, etc.)

I have some additional information not posted yet about the encoding of fields in the EEPROM, and I hope to get to upgrading that eventually.

Note that the TW file has only a subset of the parameters in the EEPROM. For example, the programmable band limits and the FM broadcast channels are in the EEPROM, but not in the TW file.

David / K7DB

Thanks a lot for posting to the group! Your software is great, it is very nice to be able to program the radio natively under Linux!!
One question, do you think it would be possible to add the capability to edit the saved broadcast FM radio? Unless I missed it I don't think it is possible from the Windows software.
Also another idea would be to add support to import / export to the original tw files (this would make it easier to share configuration files with people using the windows software). I think someone published code to the group that can do that from Excell, if I find some time I might have a look a it.
Thanks again for your code!!

One thing that strikes me about Chinese companies is even casual inquiries are treated as a potential business contact. I emailed one company last year asking about pricing for flash drives with a logo and ever since then I get emails from that company with products and pricing for several flash drives, mp3 players, and MID/tablet devices. Pretty impressively persistent, every sale counts.. good mentality for a business.

Hi All,
I use the official software under wine to program our KG-UVD1P and it works well but would love to be able to sort entries with a spreadsheet program so am interested in this software. However am a bit weary about killing the radio by doing it wrong!! having read the warnings in the readme files. Is it easy to get it wrong? what experiences has others had? any tips.

Hi,
I have used it on my radio, no problem, works great! I think it's safe as long as you don't mess with the frequency range function (equivalent to the unlock software).
Cheers,

JM

I have used David's spreadsheet that modifies .tw files and it works just fine. I make many changes weekly when working on various repeaters to make the Wouxun more useful for testing and I have no problems.

I also use David's spreadsheet. I unlocked the spread sheet to add an additional column I label "Group". It is in this column I indicate the type of programming in that particular channel (eg. GMRS, VHF ham, UHF ham, PD Monitor, BizUHF, etc.) Then I can sort the programming (except column A which is Ch #) into the various groups together. Save it and load them into the radio. Works great.

in Ubuntu GNU/Linux

Hi All,
I use the official software under wine to program our KG-UVD1P and it
works well but would love to be able to sort entries with a spreadsheet
program so am interested in this software. However am a bit weary about
killing the radio by doing it wrong!! having read the warnings in the
readme files. Is it easy to get it wrong? what experiences has others
had? any tips.

Hi,
Yes indeed I was also referring to the command line linux software from SP5GOF (actually it can also be used under windows if you compile it under cygwin). SP5GOF did some very impressive reverse engineering work, this is the only software I am aware of that can potentially be used to edit anything from the radio eeprom. This is very powerful but can be dangerous if you don't know what you are doing. However, using it to import/export to CSV files, editing channels and uploading back to the radio I have had no problem. I think it's safe as long as you don't start messing with stuff like the frequency range.
Great to be able to program the radio natively under linux. Thanks to SP5GOF, Linux seems to be the best OS to program the radio (just looking in the archive with all the people having problems with drivers, it's just plug and play under linux :-)

/JM

Looks like a bunch of fluff to me in an attempt to gloss-over
that it can only transmit in-band on the amateur frequencies. It
says it plain as day in the description. I'd rather skip the "textured
case" and 1700mH battery and keep the flexibility to use it on
out-of-band frequencies. Why would anyone care about
adding a personal power-on message? If you forgot your radio
somewhere, an honest person might turn it on and see who it
belongs to, but 9 times out of 10, they're just going to take it
home with them anyhow. I'd rather engrave the case with some
contact info (like under the battery). Call me cynical, I call 'em
as I see 'em.

BTW, PowerWerx is the U.S. distributor for Anderson Power
Pole connectors. They're a great company to deal with.

Well don’t that beat all!!!

If you waited until 999 people joined the group and then you joined, you get a radio. And just what does that say about the first 999 people? Or those who purchased a radio and THEN joined the group? Those that purchased a radio first are the ones who took a chance on a radio that has a list price which blows Icom, Kenwood and Yeasu out of the water. I’ll bet there were many who hesitated just on the suspicion generated by the old adage “you get what you pay for”, thinking the radio must be a piece of junk for the price. So here we have someone, could be anyone, who waited to see what the first 999 people were saying about the radio before joining the group or purchasing the radio. A smart buyer to be sure. I guess the first 999 people were just foolish, had a couple of bucks burning a hole in their pocket and made the purchase on sheer speculation. Because the other old adage “a fool and their money are soon parted” also can hold true-and would have if the radio turned out to be junk. Include me in the “foolish” group.

Don’t read this to mean I think the radio is a piece of junk, I don’t. I love my radio. In fact, so far the only complaints I have deal strictly with the manual and software help file. When are they going to learn to use someone in the market they are addressing to write the manuals and help files for any software they may have? Icom did the same thing with their D Star radio, and declined an offer even after their US people told them they saw problems and would be happy to put out a manual geared for the vast English speaking American public.

Congrats to the winner and I wish you every success with your new radio. It’s a nice one even if the price were comparable to the Icom, Yeasu or Kenwood. But the fact the radio has a very affordable cost makes it a real find in today’s economy.

Bill

Its the same radio I just bought just different case and locked frequencies. Would guess you could use the software from one on the other but did not try. If you scroll down in there add there's a pdf file of the qst review of the kg-uvd1p so they must be the same inside.

Bill, To buy "cheap" or not? I saw the radio advertised, and thought "must be a total piece of junk at that price", but it was certainly affordable! It even had some good reviews (and a few bad ones) on Ham Boards. So I decided to take a flyer and maybe if it was a piece of junk I would be able to make use of it some way. So my purchase was a bit like a "bring and buy" at a HamFest (and, to be honest, not far off a similar price!).

Now? I wouldn't be without my UVD1P, and I have another on the way for my XYL, as she'll hopefully be licensed in a week or two (don't tell her though - it's a surprise congratulations gift!). This group is a wonderful self-help organisation. What a great rig - but what a shame the almost unreadable "English" manual lets it down :(

Powerworx Manual? Further to my earlier comments about the Powerworx offering with "English manual", the downloaded Quick Reference Guide from their site looks to have the same language problem (like - "Vice Frequency") so I suspect they did nothing except to add their own name to the Chinese "translation". Guess their full manual will be likewise (?)

Well don’t that beat all!!!

If you waited until 999 people joined the group and then you joined, you get a radio. And just what does that say about the first 999 people? Or those who purchased a radio and THEN joined the group? Those that purchased a radio first are the ones who took a chance on a radio that

Anyone can contact Wouxun and have their custom-made radio manufactured. Not sure how many you'd have to commit to... probably a couple thousand. When you email them, the mail body even brings up a default text body (company, how many units, etc. --pretty straight forward on what kind of message they want to see from you).

Anyone ready for a KG-UV4D? It could have a blue tuning knob or something? Anyone? The KG-UV5D could come with a purple wrist strap, no? (Hey, it'll keep the competition sharp and prices low, good for the buyer).

A couple weeks ago I googled 'KG-UV3D' and "WhoIS" came up with a result... didn't think much of it back then (the domain was registered Sep. 9, 2010...) --so, they've been on this for some time.

Expect more of the same... oh, and when can we see pink housing shells all over on eBay?

I am a Ham, but also use my Wouxun at work on UHF. I find it very handy to have a radio legal and operable on both bands.

For a minute, I was feeling a bit peeved that I bought an "older model" of the Wouxon.....right up til I read the part that told me the "new model" didn't let you operate on anything but the Amateur frequencies. I'll enjoy this HT immensely, because it DOES allow me to go between Amateur and business freqs. and it is legal to do so, because of the Part 90 classification. Yeah, I know other people mod their HTs for this type of operation, but the legality is another matter.

Rock on Wouxon......

Yeah, if you go to https://fjallfoss.fcc.gov/oetcf/eas/reports/ViewExhibitReport.cfm?mode=Exhibits&calledFromFrame=N&application_id=877723&fcc_id=\\%27WVTWOUXUN04\\%27 and click on "SAR" then you'll see that the "Test Report" (filed with the FCC Feb. 11, 2010) lists the KG-UVD1, KG-UVD1P, KG-UV2D, KG-UV3D all for FCC ID WVTWOUXUN04.

Agreed on the KG-UVD1P, though. The KG-UV3D is now already up to $130 shipped (but includes the 1700 mAh batt. pack), whereas you can have the KG-UVD1P shipped for $105 (409Shop, etc.). Not sure what that copper look of the ~$125/shipped KG-UV2D is supposed to do for me... buy, hey, nothing wrong with a couple of options!

Topic: 3048 Message: 3089

Stu, I opened the PowerWorx manual in Adobe Acrobat Pro,
and it's not locked. The first page and the second page are
merely graphics (like a .JPG). I "copied" page one, and opened
it in Photoshop, and it opened and was fully editable.

If you can document the changes you would like made (and it's
not too labor-intensive) I can make the changes and send you a
copy. Your info would have to be fairly detailed- because the
document is not "searchable" (you can't search for words in an
image file). For example (not a real selection pulled from the
document) ITEM 6, word VICE, suggest change to ALT-VFO.
(Or whatever you think it should be changed to.)

Vice is not really a bad choice of words if you think about it-
dictionary.com's third description of the word says it means
(preposition) instead of; in the place of. I can see where someone
who uses English as a second language would make that mistake.
(Which isn't really a mistake, it's just not a common use of that
word.)

If you really want to see some way-off uses of English, check out
engrish.com!

3091. Using UV3 software with UV1

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-11-01 16:06:15 UTC
From: steve_ve6vs
Topic: 3091 Message: 3091

I downloaded the UV3 software from the Powerwerx site and made some interesting discoveries. For all intents it seems to be the same(ish) software as v.15. The custom welcome screen can't be sent to an older radio.

BUT if you insert a hyphen in the channel name it appears on the UV1 radio as a blank. The channel name will not accept a space, so to get one enter a hyphen.

A little thing. Just pacing the shack for the mobile to come out.

P/S the Vista USB driver works fine, I don't have a W7 machine to try.

Yeah.. keeping it legal and custom programming for commercial users.
They don't want a radio getting into the wrong hands on the wrong
frequencies.

3094. Lock radio out of dual listen

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-11-01 16:28:02 UTC
From: Garrett
Topic: 3094 Message: 3094

Is there anyway to lock these radios out of the dual listen feature? I know the TDR button switches out of the dual listen feature, but is there a way to lock it out permanently with software? I am considering purchasing several radios for a very low budget fire dept. which has a limited number of radios. Dual band would be great for us, as we use VHF, but several surrounding dept's use UHF. The dual listen feature only complicates things and makes it more likely to miss an important message. Most firefighters are not radio junkies like me, and most of you. They simply want to turn the radio on and set it to the proper channel, I would prefer for them to not have to worry about the TDR or A/B buttons.

Hi Garrett,

As a retired firefighter (1983 to 2003), and a radio nut, I feel qualified to address this. The first time one of your firefighters goes into a burning
building carrying one of these sets and it fails, and they lose their life because of a loss of communications, want to venture a wild guess who their family's lawyer is going to come after? Steer clear of these for firefighters. You might think that having these is better than having nothing
at all, but the fact is, unless a crew has a radio with them, they have no business going inside. Radios that are designed for the purpose that have been "steam tested" and certified explosion-proof are the only radios your crews should be carrying. If you hand one of these out, chances are that someone will take it into a building and depend on it, even if you have an SOG/SOP that states otherwise. And if it fails, someone will be on the bad end of a lawsuit. Great idea (additional working radios for your crews) but bad implementation (radios not certified for the job).

I don't see a way to lock out the TDR or A/B buttons except with the * button which locks everything including the channel select button. About the only thing that works is the volume control, and the flashlight and squelch. The only thing I can suggest is to only program VHF channels in them and hope they don't figure out how to program anything in on their own. There is a option to set a password but what it features it locks out I haven't explored yet. Maybe it locks out programming by the keypad and/or software but again I haven't explored what it can do.

I too agree with Web, Garrett on using these on the fireground. As he stated there are radios made for this but they are very expensive. Especially on hazmat situations where explosive hazards exist again having the right type of radio is important. For scene response the Wouxun are fine but not for fireground activities.

Web,
I understand exactly where you are coming from and I do tend to agree with you, however, the very few radios that we do have are also not anywhere even close to being public safety grade radios. They are old low end Kenwoods, that will soon be obsolete because they cannot narrowband. Short of receiving a grant, there is simply no way we can afford even a few public safety grade radios. I do feel strongly that these radios would be better than nothing, but also not ideal. I want a radio for each and every SCBA seat plus the apparatus driver. I can fill this need for 12 radios for less than the price of two public safety grade radios. Plus the Wouxun will allow us to talk to our neighbors, so I would need additional UHF radios for this purpose if we went with other radios.

I would wright for a grant and get a better radio for use in fires. OK with that said these would be fine for in truck use or out side of the fire but I would label them as where to use them. As for talking to other departments I assume there OK with that. I most cases only a small group would need a better radio to enter the fire. I know there was only 3 or 4 people that entered my house during our fire last Nov.4.

Well Garrett, the best thing I can suggest at this point is to run your proposal by a lawyer who is experienced in case law related to fireground injuries and deaths, lay all your cards on the table, and see what kind of advice you get.

You seem to have your mind made up, but now that it's public record that you have been advised by others (myself and one other retired firefighter) who are experienced in this (this group maintains e-mail records for years) if anything were to happen, I'd hate to be in your shoes! A good lawyer would be able to dig up this thread on Yahoo.

Let me advise you how my department accomplished what you suggest- we put headphones at each seat position. Each headphone carried audio from the mobile two-way set. The only headset that was capable of transmitting was the one that the officer had (riding shotgun). As far as handhelds, only the team leader of each team possessed a radio, not every member of the department. For other reasons (no need to get into them here) you really don't want every firefighter to have their own radio capable of transmitting on the fireground frequency, do you? The term "mass chaos" comes to mind.

Each station house needs about four portable radio to be effective (I'm thinking small stations with an engine and a ladder in-house.) I guess you realize the two-in/two-out law reigns supreme now, right? Even a small volunteer department is expected to muster a complete exterior team with identical capabilities for each interior team. Being a small department does not create an exception. So if you have two crews inside a building, you must have two crews outside the building waiting in case something happens, and you can't assign those teams to other tasks, they have to stand by the door in case they're needed to rescue the interior teams.

I don't mean to be lecturing to the choir, and I've gone way off topic in my example. If you're a bona-fide fire department with government sponsorship, you should be able to write a requisition for what you need to save lives and property once you explain the minimum practical you require to meet federal legal expectations for a fire department. You need to put your local government council (city? county? state?) on warning that if lives are lost because of a lack of their providing adequate funding for your requirements, that they'll bear the brunt of any lawsuits because you've laid out your plan for fire protection, and they will be rejecting your request for funding at their own

legal peril. Make them understand just how legally responsible they are for providing what you need to do your job safely. Justify it each and every step of the way. If you do it right, you'll get what you need without having to resort to unsafe radios. (And I use that term in the strictest sense of the word- think, would you key up your Wouxun in an explosive gas atmosphere? No, but you could do that with a Motorola that is gas-sealed and designed for that job.)

On the other hand, I'm not sure that Motorola makes a dual-band handheld certified for use in explosive atmospheres. However, unified command structure dictates that the only person who should be capable of communicating with other agencies would be the incident commander, and since he/she is almost ALWAYS outside of the danger area. A Wouxon might be a prudent purchase for THAT INDIVIDUAL. But then you get into reliability questions. I've seen reports of Wouxun PTT buttons not being 100% reliable.

I think you have to really think about what position you're in. You bear a tremendous legal responsibility, not only for the safety of your firefighters
but to the citizens whose lives you signed on to protect and to serve. I don't want to take away from what appears to be a very nice radio for the money, but when someone's life is on the line, would you really want to depend on your Wouxun?

I've carried on enough. I won't justify my thoughts any further.

Best of luck, -Web

Garrett wrote:
> Web,
> I understand exactly where you are coming from and I do tend to agree with you, however, the very few radios that we do have are also not anywhere even close to being public safety grade radios. They are old low end Kenwoods, that will soon be obsolete because they cannot narrowband. Short of receiving a grant, there is simply no way we can afford even a few public safety grade radios. I do feel strongly that these radios would be better than nothing, but also not ideal. I want a radio for each and every SCBA seat plus the apparatus driver. I can fill this need for 12 radios for less than the price of two public safety grade radios. Plus the Wouxun will allow us to talk to our neighbors, so I would need additional UHF radios for this purpose if we went with other radios.

There are some good points about the Wouxon radios namely the price.

There are some BAD points are far a public safety radio, especially for firefighting. The radio is not MIL-SPEC for moisture. Its not FM approved for hazardous environments.

I use my radio for public safety (Paramedic Supervisor) but not where it will get wet or when I operate in a hot or even a warm zone. I don't know if I would want to depend on it for life safety.

You may have to get creative with fund raising to get new radios that are built for the punishment of firefighting.

From: Brian Sterling
Topic: 3103 Message: 3103

I agree with the consensus on NOT using the Wuxun radios in a fire fighting scenario. While this is a Wuxun forum, I would suggest you look at the Standard Horizon HX370SAS VHF only radio with the programming software and cable for your interior teams if you are looking for a reasonably priced intrinsically safe radio certified for hazardous environments, At only around $225 each for the radio and another $80 or so for the software and cable they will save you from a lot of possible legal liability from using the wrong radio for the wrong job at about a third of the cost of an equivalent "M's" radio.

Web,
NFPA is now suggesting radios for each and every SCBA unit, mainly for the purpose of Mayday reporting. 4 handheld radios simply do not meet the standard any more like you propose. And I sure don't know where you come from, but I've never seen a unified command setup for a normal residential structure fire even though there are multiple companies working there. The mutual aid companies simply report to the Incident commander, so everyone on the fireground uses the same frequency. I also don't think there are likely to be any issue with lawsuits, because it is almost impossible to sue an employer(vol. FD) when Workers comp insurance is provided. I also do not believe that NFPA states that "public safety" grade radios are to be used. I'm pretty darn certain that it would be much easier for a lawyer to win a lawsuit when we have no radios for our interior crews when NFPA recommends it, versus using lower quality, but still certified radios. I would also ask that you please provide any law or recognized standard that requires "public safety" grade radios over other ones? I doubt you will find it..... it is these types of documents that stand up in court.

Also, we are a legitimate fire company, operating two engine companies, providing service to three municipalities. We receive 0 funding from these municipalities, all of our funding is through donations, fundraisers, and rarely state or federal grants. Not all fire departments are funded primarily by tax dollars as many people believe. There are several different ways that fire departments across this country are funded. Some are tax funded, some are subscription/fee funded, and some are funded like ours by fundraisers only.

We have written grant proposals for radios several times, but have been unsuccessful to this date. What do you propose we do in the meantime while waiting for the grant money to come if it ever does?

Also Garrett there are a number of grants available probably under the umbrella of Homeland Security. Also if there ia large fire department near you that you are on friendly terms with see if they have grant writer who can assist you in writing a grant to buy at least a couple of radios that meet the specs that Web suggested and then maybe as he also suggested is get the local powers to be to ante up some more money to buy a few more. Also why you are checking see if there are any other departments that are in the area that contemplating radio purchases. Maybe you can jump on a bid process with them to get a better price.

3113. KG-UV2D question

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-11-01 21:13:33 UTC
From: Arizona
Topic: 3113 Message: 3113

Does this group also help with the kg-uv2d model? If so I have a few questions. Just took mine out of the box. went to wouxon.us clicked on the software tab, got the usb driver for XP, went back to the programming software tab, found this "KG-UVD1P v1.15.exe" and this "KG-UVD1Pv1.16.exe" installed both. Was that a problem? When I chose to "run" the program it puts a little icon in my bottom tray. When I click on it, it does not completely open. The left side of the screen looks like an incomplete tree of some sort with no information there at all. Even now when I click on the icon in the bottom tray all it does is expand only the left side and it keeps my previous page (this one) in the main viewing area. It also seems like my computer is not seeing the usb connection. Any help would be appreciated.
Thanks

Actually, they probably use the KG-***.zip unlock file to set the transmit frequency range of each individual unit. The upper and lower frequency ranges are both variable in the software, so all models can be in stock!

Hi friends,

I do not disagree with the idea of getting radios designed for the intended purpose, e.g., in this case volunteer firefighters. That is very important. However, the most important thing is to ensure that the organization has liability insurance with huge limits which covers the organization, employees of the organization, and volunteers with the organization.

Insurance not only protects the insureds from liability, but also pays legal costs. Any time there is a bad outcome anybody involved is a target for a lawsuit, almost without regard for the merit of the claim.

It is important to get insurance from an agent who specializes in your type of risk, because there are important options in purchasing insurance which can be hard to understand and regarding which the advice of an expert is invaluable.

Bottom line: I'd much rather have optimal insurance and suboptimal radios than suboptimal insurance and optimal radios.

David / K7DB

Here is a place that had some in stock this past Saturday. Call them to see what is included. I got mine with the programming cable and software for the indicated price. I know you can get them a little cheaper on line, but it is an alternative source. They are in CT.
http://www.lentinicomm.com/cat/specials.htm

The radio gets good reports and is comparable to the big three products. I posted a file with select New England/NYS repeaters in the event you do get radio, cable and software and you are in New England.

3117. KG-UV2D question

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-11-01 21:47:02 UTC
From: Buddy KD4UXM
Topic: 3113 Message: 3117

I have used the version 1.16 numerous times with no trouble at all; programming at least five radios at different times.
The frequency unlock software download also works as designed.
However; I have a friend who has the same downloads as mentioned above that will not open completely on his computer. This I cannot explain, but the same downloads work super on my computer. I'm still pondering this!
If the download won't install or run properly on your computer, perhaps try it on a friends and see what happens!
Just my personal observation... And apparently the UV2D models have no problems running the UVD1 software.
Hope this helps and clarifies some potential confusion.
73 and good luck...Buddy KD4UXM.

Thank you for your response. I have tried on an XP machine AND a Vista machine neither one can open the programming s/w. I like to think I have at least average intelligence but I've been trying to program this thing for more than 5 hours now. My patience won't last much longer before I am forced to put this thing under my truck and smash the thing. So far not impressed.

Enter your vote today! A new poll has been created for the
Wouxun_KG-UVD1 group:

In the Group and files section you have seen the announcement of the new Wouxun-uv920R mobile rig expected to hit the market in 2011
Knowing what has been mentioned re features and your experience with the KG-UVD1 model at what price range would you be willing to buy this new rig?

o $99--$149.00 US
o $150--$199.00 US
o $200-$249.00 US
o $250--$299.00 US
o $300 up

To vote, please visit the following web page:

If you really want to hit that repeater try a Slim Jim from N9TAX on eBay. I hung mine inside a piece of 1" PVC pipe about 6' long and mounted it on the eave of the house. Really gets out compared to the plain HT.

I don't know why it won't run but I know a work around. Run the .exe from the folder in which it is located. There seems to be some magic with shortcuts. I fixed it on my computer but forgot what I did.

More FYI- Use Ver .16 it is later than .15.
I figured out my problem that resulted in your blank display. If I go to the .exe and Right Click and Pin to Start Menu, the start menu item produces the blank screen with border only. If I go to the .exe and create a shortcut and move it to the start menu, the .exe works properly. When it runs, select appropriate Comm Port from menu and try reading the radio before writing anything. Hope this helps.

> Does this group also help with the kg-uv2d model? If so I have a few questions. Just took mine out of the box. went to wouxon.us clicked on the software tab, got the usb driver for XP, went back to the programming software tab, found this "KG-UVD1P v1.15.exe" and this "KG-UVD1Pv1.16.exe" installed both. Was that a problem? When I chose to "run" the program it puts a little icon in my bottom tray. When I click on it, it does not completely open. The left side of the screen looks like an incomplete tree of some sort with no information there at all. Even now when I click on the icon in the bottom tray all it does is expand only the left side and it keeps my previous page (this one) in the main viewing area. It also seems like my computer is not seeing the usb connection. Any help would be appreciated.

If you're handy with a soldering iron (a skill every self-respecting, non-physically-disabled ham should possess), and have the manual dexterity to operate your computer and order the wire from The Wireman, you can probably make that antenna yourself for around $3.00 to $5.00. I was a little shocked to see that he sells them for as much as he does! I know, I know.... it's called entrepreneurship. (Grumble grumble...)

The problem is that it's written in "Engrish", not "English". Some people call it "Chingrish". The words don't quite match up what we use in every day use of the language. See http://www.engrish.com for examples.

3136. 144/220 mhz

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-11-02 05:09:15 UTC
From: ae5fy@sbcglobal.net
Topic: 3136 Message: 3136

Hey yall,
Just got my KG-UVD1P on Saturday. I bought it from Main Trading Company in Paris, Texas. I sent the company an email with some questions and my phone number and the owner called me right up. He answered my questions and after talking to one of my coworkers that is also a ham we ordered one for each of us. Got them in the mail in about 3 days. MTC worked out great for me and for anyone local to Fort Worth they will have several tables at the WC5C hamfest in Azle on the 13th.
I got the 144/220mhz model and did a quick test on the output. Using a Bird wattmeter I had 6 watts out on 223.000 and 5 watts out on 145.000 on high power. Low power cut the power exactly in half. I really got the radio to have a 220mhz HT and am very pleased. Audio reports are very readable with a slight hint of static from my coworker from about 16 miles away on high power.
As far as programming with the software I have found that I have to run the program (v1.16) right off of the cd that came with the radio while it is in the computer cd player. Copying the program or whole CD to the hard drive did not work. Also the other program in the files section to open up the bands allowed me to program the freqs like a tribander but no transmit or recieve on the 440mhz band. The radio I recieved is a J:10 so maybe it worked with older versions.
Bottom line, I am very pleased. Where else could I get a 220mhz HT with 6 watts out for such a low price? My VX7r does 220 but only .3 watts at three times the cost.
Thanks to the group for the wealth of info.
AE5FY
Jim

If it is a zip file, make sure to extract all to a regular folder on your desktop of something first. I just had the same exact issue on another computer yesterday. The icon to open the program should look like an actual hand held radio, not just a box.

Another thing I just noticed, the Wouxun's temperature range specs are the exact same as the "big boys" high end public service radios. Also, on most public service radios the Intrinsic safe rating is an optional feature, costing even more. I sure wish Wouxun would obtain more testing to determine a water/dust/vibration resistance rating. By most personal accounts the radios have been pretty rugged.

Talking about entrepreneurship, there is a guy seeling them on eBay that builds them on mounts a SO-230 with the shield on the + side and the center of the coax on the short leg of the antenna, and appears to have sold a bunch ot them! We made them locally out of copper tubing and they work great, just not too portable. Mine is mounted on the fascia board of our house just outside my window. Some people will buy anything rather than meke it themselves. Have a great and blessed day,

Bill WV5TX

Hi George .
Yes they are I have one seems to be the same as the 2/440 radio except for freq range

Subject: Re: [Wouxun_KG-UVD1] Are these Radios available?

Here is a place that had some in stock this past Saturday. Call them to see what is included. I got mine with the programming cable and software for the indicated price. I know you can get them a little cheaper on line, but it is an alternative source. They are in CT.
http://www.lentinicomm.com/cat/specials.htm

The radio gets good reports and is comparable to the big three products. I posted a file with select New England/NYS repeaters in the event you do get radio, cable and software and you are in New England.

First let me say thanks to all who have responded to my thread and especially Ed. This is the update so far. Ed sent me the programmer in a zip file. I unzipped it to my XP machine and it still did not work. Put it on my Vista machine and got it to work. Don't understand why it doesn't work with XP. The only thing I can think of is maybe my AVG virus checker but that doesn't explain why it only partially opens. ANYWAY, I got it to play last night but when trying to decypher the manual while trying to become familiar with the buttons and knobs and what they do, I must have somehow muted this thing because no I have no audio, geeez, I can hear QSO's on my base station, see that the busy indicator shows activity on the HT but no audio is coming through. Guess I'll have to do a reset and start from scratch. That means going back to the manual...anyway a big thanks to Ed who went above and beyond, not many people like that around anymore.

Yes they are I just got one from. http://www.409shop.com/shop_ it takes 8 days from China . I just got one hoping that I could hit the local repeater but no luck I'm down behind a hill.[for sale or trade] have the double charging tray -programing cable- 2 battery's original and a 1400 ma-2 antennas-speaker mic- manual -original packing $150 not a big discount but it's all only a month old

I'm not made of money either, but I'll be glad to make one
for you if you're physically unable to do so and send it to
you for free. Won't be dual band (unless I can find the plans
for such) but it'll work find on 2M. It'll have a PL-259 connector
on it. You'll have to supply your own barrel connector (PL-258)
and coax with the proper connector to attach to your radio.
Contact me off-list if you're interested.

From: jeffmarshall911
Topic: 3094 Message: 3157

I saw this post and have been chewing on it for some time. As a Lt. who has responsibility over comms for my department and an owner of a Wouxon and a line officer, I found myself with several conflicting opinions on this. You have already received a number of great and valuable opinions.

A few comments:
1. The Wouxon KG-UVD1P, while a competent radio, is not built to the needs of the fire service. I don't know how many incidents that you routinely respond to, but I know that I'd be tossing these radios in the trash on a routine basis (there is no real service shops available for these). Outside of the intrinsic safety of standard (and expensive) public safety radios, the Wouxons just cannot survive our day to day job once you put them to work. If you are discarding a number of Wouxon radios a year then you aren't really `saving' any money considering the big picture.

2. The Wouxon cannot handle the channel steps necessary to reach some of the new `splinter' frequencies. Nearly none of the NPSTC national interop channels can be programmed. There are many detailed threads on this board about this topic. Check your needs before purchase.

3. There are too many buttons. If I gave one of these radios out to the guys, they would be forever poking at it until they broke it (see #1 above). My programming cable recently broke to test out your original question (i.e. disable all the buttons) ☐ maybe someone else could test. I guess a case could help that blocks easy access to all the buttons (if you could find one).

4. I have used mine as you describe. I've got a VHF Kenwood TK-5210 issued through a state-wide DHS grant but we've got a few regional FD holdouts, some on UHF. It's nice to be able to listen and communicate with a mutual aid company. The Wouxon won't go beyond that though. My Kenwood radio is part of my lifeline and my Wouxon stays on the apparatus and the Kenwood is on my strap. (With 24 of the Kenwoods in service for 4+ years; only 1 failure and that was via a direct run-over by an apparatus).

So my final comment is there are lots of silly things we do to ourselves in our industry. My suggestion is to not rely on these radios to help you when (your) life safety is concerned. I know departments that use GMRS radio for things like work details, searches, etc and maybe that's a good plan for your department considering the Wouxons.

Now the side comment about the various grants available to you (there are many). There are many on-line resources on how to help write grants, qualifying criteria and tips for success. The key to success IMHO is defining interoperability, life safety, and incident management. Asking for X dollars for just your department typically won't pass the criteria. Get a number of departments together (e.g. regional mutual aid compact) on a single grant application, don't ask for the moon, but ask for your needs, how those dollars will impact firefighter safety and improve business, and show a perpetual management process so that you're not asking for money again in 5 years to replace what you just bought.

I feel for you and your challenges; stay safe,

/Jeff

I'm not made of money either, but I'll be glad to make one
for you if you're physically unable to do so and send it to
you for free. Won't be dual band (unless I can find the plans
for such) but it'll work find on 2M. It'll have a PL-259 connector
on it. You'll have to supply your own barrel connector (PL-258)
and coax with the proper connector to attach to your radio.
Contact me off-list if you're interested.

Tried adjusting squelch all the way each way, that didn't work. I think my problem is the rcv ctscc. I have tried to go exactly by the manual to turn it off but to no avail. Also tried to go by way of the menu and that doesn't work either. I'm pretty sure that is the problem but am unable to turn it off.

You really don't need tone on Rx unless you happen to have nearby interference.

Not all repeaters encode their output... They just require a "tone"
for access.

Topic: 3113 Message: 3166

I just figured that out. Think I almost got this thing whupped. Funny thing after about an hour of trying to turn off the pl tone via the ht, decided to ry via the s/w, that worked but am unable to change the pl tones to OFF via the direct entry. Anybody else experience that? Also went back to Eds site to try opening the programming s/w and failed again. Had to go to the zip file that he sent. Not complaining just perplexed about that. Thanks.

Try deleting the entry for that memory location. Then re-enter it without the tone for the output side of the repeater.

I just woke up-- I use the SW and forgot a limitation of direct programming---You cannot change features of a stored channel. Delete the channel and re-save it with desired changes.

Do you have a beam? I used to live on the side of a hill like that, with another hill even higher beyond that. You'd have thought that I'd never have got over that lot, but I found that by beaming AWAY from the hill I got R5 signal reports both ways.

We never did figure out why but the land in the direction the beam was facing was dead flat, with no power lines, fuel storage tanks, or anything we could think could be reflecting the signal, despite a lot of head-scratching!

Hey, Gang:

I just got off the phone with Richard Lenoir at Main Trading Company www.maintradingcompany.com and he informed me that the coupon for $10 off has expired. But before I go on, lemme tell you about the Wouxon KG-UVD1P I just got this morning from the postal carrier!

In literally a matter of minutes, I had the radio opened, battery installed and the CD which contains the software for programming in my laptop. From there, I plugged in the cable, and did a capture. It worked first time!!! (I run Win 7, btw).

Now, here's the deal: I ordered this HT from Richard last week. I DID manage to take advantage of the coupon, but NOBODY gives a better package anywhere to my knowledge. For $129.95, (less $10 coupon), I got the radio, FREE Priority Mail shipping, the programming cable and software. Even at full price, you won't find a better deal...period. And so, I talked to Richard again today (as noted earlier) and he told me that if the radios he has in stock sell out, the $10 off coupon will go back into effect!!! On top of that, if you have an order of 10 or more, call him for an even better deal.

For the record, I do not know Richard (other than our dealing last week), and I make nothing for this endorsement. I simply want to see other Hams get the same great deal I got. And I don't think anyone would argue that this IS a great deal. Have fun, friends.....I have a new dualband Wouxon to finish programming and play with!

I'm glad you mentioned that because I did not know that. I was afraid I mught have had a defect WHEW! That makes me feel a lot better. I am learning a lot from you guys not to mention the trial and error effect. Glad I'm getting in on this fairly early, I'm sure I'll be able to help someone soon as opposed to being helped so much. This is a great forum. KD4KOC

I unzipped it to my XP machine and it still did not work. Put it on my Vista machine and got it to work. Don't understand why it doesn't work with XP. The only thing I can think of is maybe my AVG virus checker but that doesn't explain why it only partially opens. ANYWAY, I got it to play last night but when trying to decypher the manual while trying to become familiar with the buttons and knobs and what they do, I must have somehow muted this thing because no I have no audio, geeez, I can hear QSO's on my base station, see that the busy indicator shows activity on the HT but no audio is coming through. Guess I'll have to do a reset and start from scratch. That means going back to the manual...anyway a big thanks to Ed who went above and beyond, not many people like that around anymore.

Great find!
Check out the new 4m versions (of prev. existing radios), including a newly listed 4m/70cm combo for the KG-UVD1P, and now also a 4m KG-816.
The 70MHz, band is a relatively new in Europe and Wouxun is right there for ya'... (US check: http://forums.qrz.com/showthread.php?t=234707).

Hardly - Here in UK we've had 70MHz (4 metres) since I was first an SWL some 45 years ago! Do you mean the SIX meter band, 50 MHz, which we have gained more recently? (and "Six" is a great band!)

As for your petition - you guys have a maximum power of 1.5KW now? Think of us poor UK hams who are only allowed to run QRP - just 400 miserable watts for our top-level licensees, while our "entry level" get only 10W (correct - TEN!). I think us Europeans should start a petition! With 1.5 KW we could save a lot of money on antennas - a piece of wet string thrown out of the shack window would do the job :D :D

This is rather interesting as we have been using the Wouxun's as a fire ground radio over the last 12 months with out any problems at all and have not managed to destroy any compared to 3 Motorola's at almost 5 times what we pay for the Wouxun's that have been totalled. These radio were issued to crews with the advice to test them to a point of destruction but so far this has not happened, also 2 out of the 3 Puxing 888's we also put into service are still in the land of the living.

They have proven to be a very robust and reliable radio and would be quite happy to rely on this in life threating situation and often do.

Subject: OFF TOPIC: Re: [Wouxun_KG-UVD1] Re: Radios for Firefighters

I saw this post and have been chewing on it for some time. As a Lt. who has responsibility over comms for my department and an owner of a Wouxon and a line officer, I found myself with several conflicting opinions on this. You have already received a number of great and valuable opinions.

A few comments:
1. The Wouxon KG-UVD1P, while a competent radio, is not built to the needs of the fire service. I don't know how many incidents that you routinely respond to, but I know that I'd be tossing these radios in the trash on a routine basis (there is no real service shops available for these). Outside of the intrinsic safety of standard (and expensive) public safety radios, the Wouxons just cannot survive our day to day job once you put them to work. If you are discarding a number of Wouxon radios a year then you aren't really `saving' any money considering the big picture.

2. The Wouxon cannot handle the channel steps necessary to reach some of the new `splinter' frequencies. Nearly none of the NPSTC national interop channels can be programmed. There are many detailed threads on this board about this topic. Check your needs before purchase.

3. There are too many buttons. If I gave one of these radios out to the guys, they would be forever poking at it until they broke it (see #1 above). My programming cable recently broke to test out your original question (i.e. disable all the buttons) ☐ maybe someone else could test. I guess a case could help that blocks easy access to all the buttons (if you could find one).

4. I have used mine as you describe. I've got a VHF Kenwood TK-5210 issued through a state-wide DHS grant but we've got a few regional FD holdouts, some on UHF. It's nice to be able to listen and communicate with a mutual aid company. The Wouxon won't go beyond that though. My Kenwood radio is part of my lifeline and my Wouxon stays on the apparatus and the Kenwood is on my strap. (With 24 of the Kenwoods in service for 4+ years; only 1 failure and that was via a direct run-over by an apparatus).

So my final comment is there are lots of silly things we do to ourselves in our industry. My suggestion is to not rely on these radios to help you when (your) life safety is

concerned. I know departments that use GMRS radio for things like work details, searches, etc and maybe that's a good plan for your department considering the Wouxons.

Now the side comment about the various grants available to you (there are many). There are many on-line resources on how to help write grants, qualifying criteria and tips for success. The key to success IMHO is defining interoperability, life safety, and incident management. Asking for X dollars for just your department typically won't pass the criteria. Get a number of departments together (e.g. regional mutual aid compact) on a single grant application, don't ask for the moon, but ask for your needs, how those dollars will impact firefighter safety and improve business, and show a perpetual management process so that you're not asking for money again in 5 years to replace what you just bought.

I feel for you and your challenges; stay safe,

/Jeff

Hi Stu, It may be allowed over here, but I decided back in the 1980's that I didn't need the high power and sold my amplifier and have not had one since! In fact, about three years ago when the sunspots were zero, I was running mobile with 100 watts PEP and in a years time I worked 42 states, three DXpeditions and I don't know how many DX stations while fighting the kilowatt stations who would tune up their amps on the frequency the DX station was operating. FCC rules state that you are to use the minimum power to maintain contact, but most stations automatically turn the amp on and run the maximum power allowed. It is a shame that so many stations operate this way when it is not needed. I remember when I lived back east, one ham had worked and confirmed all 3,079 counties in the US using 100 watts and then bought a Tentec Argonaut and was using it running 5 watts to have a challenge! Don't worry about being allowed to run high power, you don't need
it. Have a great and blessed day,

73's Bill WV5TX

Very interesting, thanks for the info! By the way, the majority of the keypad and the menus on the Wouxun can be locked out in the software easily. It pretty much just allows operation of the A/B, TDR, Scan, and lock buttons on the front. I was just hoping to be able to lock it into only monitoring 1 channel at a time.

Dave,

I'm actually glad to hear that you are asking the guys to beat the radios up. Do you use the lapel mics?

Keep us in the loop on your long-term usage/success with these radios.

Until they will do the VHF splinter freqs we cannot even consider them for anything we do. I do think that these would be great for OEM/EOC pool radios.

failure and that was via a direct run-over by an apparatus).
>
> So my final comment is there are lots of silly things we do to ourselves
in our industry. My suggestion is to not rely on these radios to help you
when (your) life safety is concerned. I know departments that use GMRS radio
for things like work details, searches, etc and maybe that's a good plan for
your department considering the Wouxons.
>
> Now the side comment about the various grants available to you (there are
many). There are many on-line resources on how to help write grants,
qualifying criteria and tips for success. The key to success IMHO is
defining interoperability, life safety, and incident management. Asking for
X dollars for just your department typically won't pass the criteria. Get a
number of departments together (e.g. regional mutual aid compact) on a
single grant application, don't ask for the moon, but ask for your needs,
how those dollars will impact firefighter safety and improve business, and

show a perpetual management process so that you're not asking for money again in 5 years to replace what you just bought.

A good example of a narrow band "splinter" frequency would be 155.075 MHz.
Needs a 1.25, 2.5 or 7.5 kHz step.

I think you're missing a digit. 155.075 would work with a 5 KHz step, which we have. 155.0775 would not, however.

That's the problem - the programming software can select 5KHz, 6,25, 12.5, 25, but NOT the 1.25, 2.5 or 7.5 kHz steps listed below (which are required by the splinter frequencies.

Scan selection is software only. You can delete a channel from the keypad but that is terminal for the channel.

Hi friends,

Regarding "I find it hard to understand why you would bring such an issue in front of a group of amateur radio operators"...

I find it interesting to learn more about communications requirements for different applications. And in this group which is formed to discuss the Wouxun radio, clearly some members have non-amateur applications in mind for this FCC Part 90 type-accepted radio.

What if you have problems with it and need help/service? I prefer to buy from a dealer in the U.S., some accessories that would not be subject to electronic problems, I wouldn't mind ordering from a dealer out of the country. I ordered a antenna for my Wouxon HT from the 409 Shop and no problems, only because I didn't see it here.

I have been following this thread about the use of these radios for Firefighters closely however waited until now to comment. Many Fire departments around my area (upstate NY) are all using a mixed bag of communications equipment. While some of theses radios are compliant a very, very , very large number of them are not. Some were clearly listed in previous posts so no reason to list them here. There is always a danger no matter what you use and though the danger may be increased by using non type accepted equipment, that is a risk some of us take. I have not come across a single FD, ambulance co, in the last 15 years of both fire and EMS service (I work as a medic) that is 100% compliant with either NFPA or EMS part 800. That being said I have been using my Wouxun radio for the past year every day I am on the job in a service that runs nearly 15,000 calls a year. So far it has not let me down and has been dropped, kicked, left on an ambulance heater vent (my fault) and still works fine with only a few battle scars on it's face. You can talk all day about NFPA or part 800 until you are blue in the face and how many of the listed chemical companies will not allow these radios on site. What these folks will not tell you though that really NO transmitting equipment regardless of it's specifications should be allowed on, near or around their property, again a risk that is taken by both the company and the responders coming in to help in time of Emergency. I however do not need to be "warned" about anything as every time a call comes in there are greater risks than what little two way radio is in my pocket. The whole point of this is: THERE ARE MUCH MORE DANGEROUS THINGS THAN WHAT TWO WAY RADIO YOU ARE USING TO BE WORRYING ABOUT! Take care of yourself and others on a scene and you will get along just fine. Oh, when I started there was no such thing as INTRINSICALLY SAFE. The only requirement that our county asks for (this is everyone folks by the way, PD/FD/EMS) is that the radio is capable of transmitting if a portable unit 4 watts on UHF / 5 watts on VHF, is part 90 certified and the same for the mobile units except that the power level must be at least 40 watts.

My first Post, in no way meaning to bash or hash just to give my point of view and most importantly my experience with the radio that is the main topic.

Take Care, Mike

Subject: Re: OFF TOPIC: Re: [Wouxun_KG-UVD1] Re: Radios for Firefighters

OK, you win the discussion. Do what you want. Just don't say
you weren't warned.

I find it hard to understand why you would bring such an issue
in front of a group of amateur radio operators. You really should
be posing your inquiry to OSHA and/or the NFPA. They would be

the definitive source of a qualified answer for you. I've taken the liberty of making an inquiry on your behalf with OSHA, and will post my findings here for you.

Here are some NFPA concerns about using non-IS radios:

All chemical companies such as Ciba, Schering, and Merck do not allow radio units or electrical devices on their property because of the potential of these units causing an explosion and causing serious injuries or death to their employees. All electrical devices must be “INTRINSICALLY SAFE” (flashlights, portable radios, etc.).

In reference to body heat thermal imaging cameras:

It is the core objective of the fire department to respond to emergencies, many of which consist of hazardous environments. It is these environments with the use of a TIC and their associated accessories that is not tested to be “Intrinsically Safe” that can be a hazard to the fire fighter. It is the intent of this proposal that a Standard under NFPA 1500 – Fire Department Occupational Safety and Health Programs be created so as to call for all TICs and associated accessories to be certified as “Intrinsically Safe” and so marked with proper labeling on each camera. If TICs and associated accessories are tested and cannot be certified as “Intrinsically Safe,” cameras and accessories must be retrofitted to be so certified and marked as “Retrofitted to be Intrinsically Safe.” If TICs and associated accessories cannot be retrofitted to be “Intrinsically Safe,” cameras and accessories must be marked as such with the proper labeling and proper training must be provided by the manufacturer as to the safe and proper use of that particular camera and its accessories. Upon adoption of this proposed standard, all TICs and associated accessories produced for use in the fire service must be certified as “Intrinsically Safe” by a reputable entity such as FM.

One final point- your PASS alarms that (I hope) each entry personnel wears must be certified to be intrinsically safe. What sense would it make to have them wear an intrinsically safe PASS alarm device, but carry a two-way radio capable of blowing them up if they use it?

Respectfully submitted, -Web Williams, WY3X

Interesting point... Does this group exist to provide information on
amateur radio applications only, or ALL applications of this radio?

After all, this radio was approved for ALL Part 90 applications, of
which Amateur radio is only approved, via the automatic Part 15 approval.

We could see commercial interests discussed here.

So... with that in mind, Is this thread really *on-topic*?

not judging, criticizing, or anything negative... just asking and trying
to make a *friendly* point

But the Wouxun is approved as a Fire Service radio.

We all remember how Mobile phones were meant to set Petrol Stations on fire but after a lot of research it was proved to be a lot of bull dust, in fact it was more a risk from.

Subject: OFF TOPIC: Re: [Wouxun_KG-UVD1] Re: Radios for Firefighters

Web,
What you fail to understand is that MOST volunteer and many paid fire departments are already operating with non IS radios. Kenwood even markets the Tk-272G radio to volunteer fire departments, it is not IS. Even many of the higher end radios from Kenwood and Motorola do not come standard as IS, it is an option that many choose not to purchase. Yes IS, is important if you go into an explosive atmosphere, but so is your brain. Many people have cell phones, etc. on them, they are just as much of a hazard. Again, there is no legal requirement that fire radios need to be IS, there isn't even an NFPA or OSHA regulation on the matter. The only legal requirement is that they be Part 90 Certified. I would venture to say that well under half of the radios in use by the fire service today are actually IS compliant.

Wow... this is a first. I am using a radio that is approved by Industry Canada (for commercial use).. hi..

In Canada our ham radio equipment doe not need to be approved. Our newer HF rigs come from the US complete with 60 meter channels and the Alaska emergency frequency. We can not use these but are considered responsible for operating our stations on the frequencies allowed by our license. It looks like in the near future we will be getting some 60 meter frequencies though different from the ones in the US.. No problem we can just open our radios for full frequency transmit and use the frequencies allowed, no law will be broken. :)

No there's to many people here to get along some one will always be mad. Did anyone e-mail Wouxun to see if they have a radio that is more fit for fire use. Problem solved I would still try the grant thing you could by some Wouxuns and some others that have been suggested and save the departments money to stock the beer fridge at the station. If you don't have a beer fridge write it in the grant.

A lot more people than hams use these radios hams fire fighters police business and others this is the KG-UVD1 group I think it is more than just an amateur radio group.

It deals with these radios how they work and such and even where it should or should not be used seems fair for the group but

THERE IS NO NEED TO WHIP A DEAD HORSE AFTER IT IS WELL DEAD

what a fireman carries on his belt is his and his employers personal choice not this groups

"Every Man Has to chose the crooked lawyer he sleeps with"

73 All

Dan

The context in which I meant that was: "why would you bring a
firefighter issue to a group of amateur radio operators, most of
whom are not firefighters and are probably disinterested in our
discussion". Clearly there are others in the group who find it
interesting, but some did not (as evidenced by their posts). So
it's a toss-up, I guess.

Hi Ken,

Is there a particular reason that IC doesn't allow you folks to
use the Alaska emergency frequency? Just curious. It would
seem to me that you guys are a lot closer than most of us!
And more likely to be able to assist..., being closer and all.

I went through the process to reserve a KG-UV920R but received an error message indicating insufficient stock. I'm not sure if I reserved one, two, or none. I like the concept of reserving one, because I think demand will be tremendous, assuming pricing is right. I'm starting to see more KG-UVD1P at club and EMCOMM meetings and everybody seems to be as satisfied with their handhelds as I am mine. I'm sure many of them will be in the market for a dual band mobile, as well.

Hi friends,

Just a few clarifications about frequency allocations... Licensing to transmit in Alaska is controlled by the FCC (non-federal governemnt users) and the NTIA (federal government users). Industry Canada (and perhaps other agencies within Canada) has full authority to authorize Canadians to operate on the frequency 5167.5 kHz within their borders, and (subject to international treaties) in international areas.

Nobody is able to control the airwaves in Alaska... electromagnetic radiation crosses the international border and enters Alaska within checking in for customs inspection.

I was able to find in Industry Canada records three Canadian stations authorized to transmit on that channel (listed as a center frequency of 5.1684 mHz):
a.. Station XON958, licensed to ALCAN - ÉNERGIE ÉLECTRIQUE -- A/S MARC ST-AMAND
b.. Station CJH334, licensed to AVENTURES NIPISSI INC. -- ALDEO BERNARD
c.. Station CFODT, licensed to AIR SAGUENAY 1980 INC. (Note: this is a station on a DHC-3 Otter aircraft.)
Perhaps (as in the U.S.) there in another Canadian federal agency that licenses federal spectrum users, and so there may be other stations authorized by the Canadian government to use this frequency.

The Canadian goverment's "Canadian Table of Frequency Allocations" allocates 5.06 mHz to 5.25 mHz to the Fixed Service and to the Mobile Service except aeronautical mobile. (Apparently they made an exception for station CFODT, which is an aeronautical mobile station.)

David / K7DB

As the airwaves in Alaska are controlled by the FCC, Industry Canada has no authority to authorize Canadians to operate on this frequency. It could be changed if the FCC and Industry Canada were to approach their respective state departments to authorize a change in the users of 5167.5 kHz.

The "decode" and "encode" listings and print out are finally fixed and accurate (none of the earlier versions were correct). Spacing does not work on portrait printouts(as mentioned channels and ch-name are cut off). In landscape mode all 128 channels print but takes 3 pages with 50 channels/page.

The supplied antenna works very well on both bands for me. I do have a Smiley telescoping antenna that is slightly better but not worth the inconvenience for me. For real good performance, I use a mag mount on my car and a slimjim from eBay at the house.

I'll confirm that - I bought at 19" dual-band antenna at a recent radio rally, but I can't notice any subjective improvement (I've not checked it with someone's S-Meter though).

Likewise, I use the "outside" antennas from the shack and the car, but I'd not bother trying to improve on the supplied antenna for true portable!

(Just bought another rig for the about-to-be-licensed XYL and only bought the "stock" antenna that goes with it - likewise I've not bothered with hi-capacity or spare batteries, as I've not needed either)

Stu

The SlimJim is quite a good aerial for 2M/70cms, but the TX bandwidth is a tad narrow. It is certainly not going to cover the whole of 136-174 or 500, as wanted by the OP.

Once you try and transmit more than 3 or 4 MHz from the cantre frequency it was cut for, your SWR will rapidly climb.

To cover the full frequency range on an external aerial, you're going to need something like a Discone.

The "decode" and "encode" listings and print out are finally fixed and accurate (none of the earlier versions were correct). Spacing does not work on portrait printouts(as mentioned channels and ch-name are cut off). In landscape mode all 128 channels print but takes 3 pages with 50 channels/page.

Web,
My guess is that the unlock software does work for the 2m/220 version. I suggest the after you open the unlock software, READ from the radio before you attempt to modify the limits and WRITE back to the radio.

That's when I found out it didn't work- trying to read from
the radio. I didn't try to write to it at all. I postulated that if
it can't read, there was no use trying to write.

I on the other hand can read from the radio but cant get the program to read
correctly it says in the read out that I only have 220 frequencies in there
but the readout on the radio says there are 2mtr frequency's also loaded .
I need to do a master reset any one know how

Just as a clarification, CHFREQ is the same as VFO mode, and
CH is the same as memory mode. NAME is pretty self-explanatory.

Date: 2010-11-08 02:01:50 UTC
From: DavidO
Topic: 3243 Message: 3243

I have downloaded the software specified by Wouxun for the KG-699E Advanced model (200 channel. It is KG08_PCS.exe. As far as I can determine, this is the correct software for this model.
When I open it, I get an opening screen that only displays active Tabs for Communication (Com Ports), Language, About and Exit. All other Tabs are "greyed out" disallowing access. I cannot get to a screen that allows entry of frequency data, etc.
Can anyone help me?

Thank you,
Dave

Keisha,
Your response leaves me wondering why I can open the programming software for the Wouxun KG-UVD1P and the TYT UVF1 without having a radio connected, but not the KG-699E "Advanced" model?

Also, I can fully open the KG-699E software for the "Popular" model without a radio connected; why not the "Advanced" model? Is there something unique about this model and its software?

Fact of the matter is, I wish to examine the programming software before buying the radio.

Thank you.

Try hitting the space bar while youare hovering over one of the grey spots, if a right mouse click wont let you access each field. Space bar works with some programming software but being away from home, I cant check this one.

3251. Concerning 2M/220 KG-UVD1P unlock

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-11-08 03:26:25 UTC
From: Web Williams
Topic: 3251 Message: 3251

Per the advice of another group member, I opened the programming software, and made sure I could "read" the radio with it before trying the unlock software. To my amazement, what worked only a few days ago WAS NO LONGER WORKING! Try as I might, the programming software would not read my HT! I unplugged the programming cable to changed to a different USB port, and it switched from COM8: to COM9:. The programming software was then happy with it again, and the unlock software was then able to read my radio. Surprise, however, it was already open from the factory! No additional unlocking was required!

According to the software, it is open 136 to 174 on VHF and from 216 to 279 on UHF.

On another subject, has anyone heard anything between 216 and 220, and between 225 and 279 that was worth listening to?

Thanks to all who responded, 73, -Web (WY3X)

The 08 software wants a radio connected before it does it's thing it has worked like that for the past 2 years when you get a radio on it it does a lot of stuff the kg-uvd1p software will not do.

I Don't know why they made it that way but that is how it works

Dave,

On some programming software, you need to read the radio before you can use all the features of the software. In other words, you can't really try out the software before buying the radio. I once had this issue with some software for a Yaesu handheld.

I have no idea if this program behaves in this fashion, but it's something to consider.

The 08 software wants a radio connected before it does it's thing it has worked like that for the past 2 years when you get a radio on it it does a lot of stuff the kg-uvd1p software will not do.

I Don't know why they made it that way but that is how it works

I have downloaded the software specified by Wouxun for the KG-699E Advanced model (200 channel. It is KG08_PCS.exe. As far as I can determine, this is the correct software for this model.

When I open it, I get an opening screen that only displays active Tabs for Communication (Com Ports), Language, About and Exit. All other Tabs are "greyed out" disallowing access.

I cannot get to a screen that allows entry of frequency data, etc.

Can anyone help me?

Thank you,

Dave

Les,
Thank you.
There is no Tab displayed as FILE in the software version that I have.
The general consensus is that the radio must be connected for the software to take full effect and I do not have the radio. I am only trying to evaluate the programming software.

3259. Built in VOX on KG-UVD1P

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-11-08 14:40:45 UTC
From: Niels S
Topic: 3259 Message: 3259

Using 2 Puxing PX-888s already and am looking to adding a 3rd radio. However I need the built in VOX function to be working together with an external mic for normal voice transmission. The Puxing VOX circuit is useless (triggers totally randomly), so I was wondering if the KG-UVD1P would be a better bet?

3260. Re: [Wouxun_KG-UVD1] Built in VOX on KG-UVD1P

I've just checked it out on my Wouxun.

With the VOX set to quite a low number (I used 2), it seems to work fine simplex, with an external speaker-mike. However I tried it on a repeater and the VOX will not transmit until the repeater RF closes. It would appear that it won't transmit under VOX mode if there is an input signal on its RX.

No - it doesn't just wait for the "K" (or T) tone - it waits until the repeater drops carrier altogether!

I uploaded it.

This software works a little different than the programming software.
You should read first. The radio may not indicate any communication.
The software seems to test all com ports to find the right one. This
can take a minute or so. The upload to the radio is practically
instant, as the software has found the correct comport.

Good repeater etiquette dictates that you pause to give others time to interrupt. Simply hearing the courtesy tone doesn't mean it's your turn to transmit. I usually pause about two to three seconds after hearing the tone, which is generally accepted as "good manners". -Web (WY3X)

Subject: [Wouxun_KG-UVD1] Concerning 2M/220 KG-UVD1P unlock

Per the advice of another group member, I opened the
programming software, and made sure I could "read" the
radio with it before trying the unlock software. To my
amazement, what worked only a few days ago WAS NO
LONGER WORKING! Try as I might, the programming
software would not read my HT! I unplugged the programming
cable to changed to a different USB port, and it switched from
COM8: to COM9:. The programming software was then happy
with it again, and the unlock software was then able to read my
radio. Surprise, however, it was already open from the factory!
No additional unlocking was required!

According to the software, it is open 136 to 174 on VHF and
from 216 to 279 on UHF.

On another subject, has anyone heard anything between 216 and
220, and between 225 and 279 that was worth listening to?

Thanks to all who responded, 73, -Web (WY3X)

Ok Dave I am unfamilar with the software for that radio. When I ordered my KG-UVD1 I downloaded the software from the Wouxun site and had all the frequencies made up ahead of time before I received the radio. So it works different then the one you have. If I should purchase the one you have I will remember this.

Have you selected NEW under the FILE tab? That should allow you to select the other tabs that are not currently available.

Subject: [Wouxun_KG-UVD1] KG-699E Programming Software Question
To: Wouxun_KG-UVD1@yahoogroups.com
Date: Sunday, November 7, 2010, 9:01 PM

I have downloaded the software specified by Wouxun for the KG-699E Advanced model (200 channel. It is KG08_PCS.exe. As far as I can determine, this is the correct software for this model.

When I open it, I get an opening screen that only displays active Tabs for Communication (Com Ports), Language, About and Exit. All other Tabs are "greyed out" disallowing access.

I cannot get to a screen that allows entry of frequency data, etc.

Can anyone help me?

Thank you,

Dave

Thanks everyone with that comment! I don't usually use VOX, do I don't have the lock off.

So does everyone agree that the VOX is good on our rigs? Seems fine to me.

VOX does work well even if the repeater RF is detected provided you set the BCL function "off"

Subject: Re: [Wouxun_KG-UVD1] Built in VOX on KG-UVD1P

I've just checked it out on my Wouxun.

With the VOX set to quite a low number (I used 2), it seems to work fine simplex, with an external speaker-mike. However I tried it on a repeater and the VOX will not transmit until the repeater RF closes. It would appear that it won't transmit under VOX mode if there is an input signal on its RX.

Subject: [Wouxun_KG-UVD1] Built in VOX on KG-UVD1P

Using 2 Puxing PX-888s already and am looking to adding a 3rd radio. However I need the built in VOX function to be working together with an external mic for normal voice transmission. The Puxing VOX circuit is useless (triggers totally randomly), so I was wondering if the KG-UVD1P would be a better bet?

Thanks guys, very encouraging answers.
Really only need the UHF band but up to 480MHz, so it looks like either the KG-UVD1 or the PX-888.
Based on the activity in the group and the need for working VOX I'll head for eBay and order a Wouxun

Actually unsure.. kind of working on that myself :)

Tried via the soundcard of computer and the radio, using its VOX function.. with bad results.

I can use same cable connected to my Rigblaster.... Need to get to this and see. Definitely a project whos results will be posted here.

The file unzips to become KG-UVD1E 2.0.exe. (The "P" has been
replaced with an "E".) Is this a misprint or is there another version
of the radio that requires a different version of the software?

This version is aleady updated on the printing issue even on the portait printing.

It is almost the same as the software KG-UVD1P V2.0 but just more fixing on the bugs.

"e" is just convenient for the difference, I have already revise it to "P" and re-upload onto the group.

The one referenced here from the Wouxon website has the same version date and internal number as the other V2, but the manufacturer's name comes up in Chinese instead of English. The executable is roughly half the size of the other one. They appear to be functionally identical.

Just to let you know.

I am a Ham Radio Operator at the New York City Marathon. On November 7 I used three (3) KG-UVD1P and one ICOM W2A. All from the same vehicle and all on their own mag mount antenna on top of the vehicle.

Two KG-UVD1Ps on 440MHz and one on 144MHz. The ICOM W2A was true dual band mode!

I also had the latest version 2 software on my laptop just in case I had to make any last minute changes.

I took along three charging stations and ran them from the 12VDC adapters pluged into the cigar lighter with a multi-tap.

Operated for 10 hours.

NOT ONE PROBLEM!

(Sorry because of time constraints, I can't answer any questions about any of the above.)

Just to let you know.

Alan, New York City.
NY2G

Never insult a mode used in amateur radio. This is not nice!
The hobby has a lot of aspects some people like and others do not.
Just because you do not prefer one mode doesn't mean others can't enjoy it.

Be nice.

Echolink is not a "mode". USB, LSB, CW, AM, and FM are "modes".
Some would say that PSK-31, RTTY, WSJT, and other digital methods
of modulating an RF signal are also modes.

"You see, wire telegraph is a kind of a very, very long cat. You pull
his tail
in New York and his head is meowing in Los Angeles. Do you understand
this? And radio operates exactly the same way: you send signals here, they
receive them there. The only difference is that there is no cat." Albert
Einstein

Echolink is nothing more than a telegraph carrying voice, and is
actually more
related to a wired telephone than radio. It's not radio at all. It's
amateur radio
with all the magic and wonderment removed. Any time you can make a
desired connection at-will and not be subject to the whims of propagation
and the properties of RF, it ceases to be radio. Why get a ham license at
all? You can hang out in an AOL chat room and accomplish exactly the same
thing without all the bother of obtaining a license to transmit on the
airwaves.

Not flaming you, merely presenting the facts.

73, -Web (WY3X)

Now buying Echolink interface boards for use as targets in
shooting galleries at nearby hamfests! Working or not! Paying
up to $1.00 each, plus another $1.00 to cover your shipping
and handling costs!

Hey guys, can we get back to Wouxun discussion instead of beating up ham radio?
There are probably some ham radio candidates on line here and bashing one "mode" or another does not present the proper perspective for amateur radio.

"Inspection, monitor, stun, kill and emergency"????

what is the native translation in English about this function?

Keisha

From: VK3FFFJ
Topic: 3294 Message: 3295

here's my interpretation correct me if i'm wrong

Inspection:- Not sure?

Monitor:- monitor button to listen too radio with squelch temporarily disabled

stun:- to stop radio temporarily working (AKA motorola...send remote signal from another radio)

Kill:- simular to stun :- but radio DEAD

Emergency:- sends out a signal/siren or programmed message (if available feature) on a prgrammed channel and local speaker

hope this helps

How about "Escalation"?
As a former police officer (many years ago), I see it as exercising the least effort to control a situation.
FIrst, inspect the area or situation in normal routine.
Monitor anything you think is not correct.
Take non-lethal action to immobilize the suspect.
Kill to prevent from being killed.
Call it an emergency and fill out LOTS of paperwork.

Sometimes we think differently when the same words are expressed.

Ed

The .tw files are the programming files for the radio. You need to open
them with the programming software that can be found in the files section of
this group (the latest version is 2.0).

Keisha:

Seems like maybe your question wasn't fully understood. This might be due in part because the KG-UVD-Series does not have this feature group as far as I can tell. Anyway, I think it is pretty cool that Wouxun staff reaches out for help from the community.

Perhaps you are trying to update Wouxun's documentation (web, user guides, etc.) --a great move in my opinion. I had to re-read through my KG-816 manual several times before I sort of understood what is happening here in the "Inspection-Monitor-Stun-Kill" section (which must be activated by the software using a computer, --for those not familiar with this).

I myself was a bit stunned when I read through Wouxun's material for the first time. I will try my best to come up with a translation as I understand it.

I will place Wouxun's original terminology is square brackets [] and offer a brief summary of what the features does (rewriting it the way I understand it. The source material can be downloaded from Wouxun). Finally I will add my suggested English translation in a comma separated list (since there were more than one term that came to my mind). I have to admit that I couldn't come up with a one-word snappy translation, however.

Others, more experienced radio operators, may constructively chime in. The attempts of humor regarding "stun" and "kill" have probably been taken care by now.

[Inspection]
Ok, I have to admit, this mode's description (page 50, KG-816) left me utterly confused. Not sure what is happening here; something is being sent out from a radio unit designated as the "master". Other units (which have been previously reprogrammed into some sort of "slave" mode) receive a signal and then return a ANI ID CODE.
Without access to at least one more radio, I can't really try this out.
I am somewhat under the impression that the following (Stun, Kill, and Monitor) are those "slave" commands TX/RX'd by the "master" unit. Perhaps I am totally off on this one...

Possible translation: Remote Mode, Master, Master Mode

[Stun]
Seems like the "master" radio can remotely stop (mute?) the "slave" radio units of a group. I.e. whatever activity is happening on the "slave" units will temporarily be suppressed by the "master" unit. The "master" unit can make a transmission that will force all "slave" units into forced receive mode.
For example a group of rescuers might be talking to each other while not noticing some other sort of looming danger (nearby fuel depot about to blow, etc.).
The incident or safety commander could then transmit using his "master" unit forcing all field personnel's "slave" units to hear his/her announcement. Apparently, if a "slave" unit

is powered down, it will be remotely turned on. The manual is less than clear on this one.

Possible translation: Pager, Pager Mode, Remote Forced Receive, Receive Override

---

[Kill]
A "slave" unit can be powered down remotely by the "master" unit. Perhaps it can be completely disabled (until "revived" by connecting to the computer using the software to re-enable it??)

Possible translation: Remote Disable, Remote Off

[Monitor]
This is essentially the equivalent of a baby monitor as we know then here in the US. Apparently the "master" unit can turn on the "slave" unit and listen in on any of surround noises, such as casual conversations. Spy mode, would be another way to express that.
A commander could assist a rescuer who temporarily cannot reach for the radio while perhaps assisting a victim under difficult circumstances to get a better understanding about the situation, --to put a bit of a positive spin on this one...

Possible translation: Monitor, Spy Mode, Remote Forced Transmit

---

I don't have any references what the context of the "Emergency" term is in context of a a radio menu. You might cite your source material for the rest of us.

Hope this helps a bit.
A.

Hello Ed,

You are quite right.

We are searching for a better vocabulary expression for these 5 words according to each function, instead of the original expression.

TKS.

Here are the definitions of the words that I feel are appropriate considering that you're describing something to do with radios. The problem is, a single word in English can mean more than one thing, and sometimes the context in which a word is used can cause it's meaning to change from serious to humorous. My wife is from Laos, and has lived in the U.S. for 35 years. She still has issues with some words, so I understand completely what your issue is. I don't have any Chinese relatives who could help, but I may be able to suggest a bilingual friend of mine who speaks both English and Chinese fluently.

Confusing examples of the word "kill":
The comedian's act killed the audience. This would mean that the comedian's jokes were a success, and that the audience really enjoyed hearing them.

The murderer stalked his prey until he had a clear shot and killed his victim. In this case, a person killed another human being by taking his/her life.

The operator killed the radio. In this case, the owner simply switched off the radio, so nobody could hear it. (In other words, he didn't SHOOT the radio with a GUN to turn it off, he merely switched it off.)

Directly from http://www.dictionary.com

Inspection:
1. to examine closely, especially for faults or errors.

Monitor:
14. Radio and Television.
a. to listen to (transmitted signals) on a receiving set in order to check the quality of the transmission.
b. to view or listen to (television or radio transmissions) in order to check the quality of the video or audio.
c. to listen to (a radio conversation or channel); keep tuned to.

Stun:
1. to render unconscious, as by a heavy blow or fall
2. to shock or overwhelm
3. to surprise or astound

Kill:
1. to cause the death of (a person or animal)
2. to put an end to; destroy: to kill someone's interest
9. /*informal*/ to switch off; stop: to kill a motor
(It can also mean to stop a running process immediately)

Emergency:
1. a sudden, urgent, usually unexpected occurrence or occasion requiring immediate action.

If you'd like me to put my English-speaking Chinese friend in contact with you, let me know.

Kindest regards, -Web (WY3X)

Here are the definitions of the words that I feel are appropriate considering that you're describing something to do with radios. The problem is, a single word in English can mean more than one thing, and sometimes the context in which a word is used can cause it's meaning to change from serious to humorous. My wife is from Laos, and has lived in the U.S. for 35 years. She still has issues with some words, so I understand completely what your issue is. I don't have any Chinese relatives who could help, but I may be able to suggest a bilingual friend of mine who speaks both English and Chinese fluently.

Confusing examples of the word "kill":
The comedian's act killed the audience. This would mean that the comedian's jokes were a success, and that the audience really enjoyed hearing them.

The murderer stalked his prey until he had a clear shot and killed his victim. In this case, a person killed another human being by taking his/her life.

The operator killed the radio. In this case, the owner simply switched off the radio, so nobody could hear it. (In other words, he didn't SHOOT the radio with a GUN to turn it off, he merely switched it off.)

Directly from http://www.dictionary.com

Inspection:
1. to examine closely, especially for faults or errors.

Monitor:
14. Radio and Television.
a. to listen to (transmitted signals) on a receiving set in order to check the quality of the transmission.
b. to view or listen to (television or radio transmissions) in order to check the quality of the video or audio.
c. to listen to (a radio conversation or channel); keep tuned to.

Stun:
1. to render unconscious, as by a heavy blow or fall
2. to shock or overwhelm
3. to surprise or astound

Kill:
1. to cause the death of (a person or animal)
2. to put an end to; destroy: to kill someone's interest
9. /*informal*/ to switch off; stop: to kill a motor
(It can also mean to stop a running process immediately)

Emergency:
1. a sudden, urgent, usually unexpected occurrence or occasion requiring immediate action.

If you'd like me to put my English-speaking Chinese friend in contact with you, let me know.

Kindest regards, -Web (WY3X)

3317. Re: "Inspection, monitor, stun, kill and emergency"

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-11-12 04:14:44 UTC
From: kc5cqw
Topic: 3294 Message: 3317

Keisha,

I applaud the proactive "focus group" request regarding this issue.
Would it be possible to describe the function/action of the radio when each of these named features is activated?

This would really help us to offer an alternative name for each feature.

I understand what the monitor and emergency functions do, but the "inspection, stun and kill" do not make much sense without more information to describe the feature.

Perhaps if a copy of the manual can be provided to the group, we can collectively perform some peer review and editing suggestions.

I personally am not an english scholar but I do have several years experience creating and editing technical procedures and related documents.

Good luck,
Damon

Try rebooting and then hooking up the cable after the system comes fully up. That usually solves my problem. (Win 7, 64 bit). Might work.

Hi all,

We are working on revising the user's manual for KG-UVD1P.

Which functions needs to be described more detailed?
Which parts needs to be re-translated or replaced by better translation?
We are planing to add the programming guide on the manual, do you have any suggestions about it?
¡¡¡¡
Any input about this manual are welcome to keep us noted. £º£©We are hoping that we can make the manual more practical and easy to guide for our users.

Millions of thanks in advance for any kindest help.

Keisha

Hi Keisha,

I would respectfully suggest that the manual be translated by someone who is an expert technical translator. This is not the same as having the translation done by someone who is simply familiar with both languages.

In the U.S. there are firms which specialize in technical translation. For example, look at the results of the Google search
a.. http://www.google.com/search?q=english+chinese+translation+localization.

Topic: 3322 Message: 3322

Dear all,

Some blind ham friends emailed us that they suggested us recording a demo of KG-UVD1P about its features and basic operations. Some hams also suggest that we do a video for the programming guide so that some freshmen can easily do the programming.It is quite valuable and we are taking it into our consideration.

Can anyone, who are experienced in this give me some guide?

Keisha

Keisha,

Can you describe what action these functions refer to? I can't even begin to guess how they can relate to radios! If you can describe what happens when you press a button or turn a switch I'm sure that our group can come up with the correct translation.

Stu

Keisha,

That's really good news, and thanks for your interest! I bought a UVD1P around 6 months ago and I just bought another for my wife who has just gained her license, as they are such good pieces of equipment and great value for money. Sadly, I had to tell her not to bother trying to read the manual as it really is so bad as to be almost useless - especially to someone fairly new to radio operation.

As far as I can tell, the manual is about the only thing that separates the quality of the UVD1P from the products of Yaesu and the others. Sorry, but it's not just parts of the manual - it's the whole of it! I know the group here would love to help to improve the manual, but how to apportion the job?

It occurs to me that there may be a Chinese native speaker "somewhere" (China? Kong?) who is also a ham with experience in "radio talk" over the air in English with native English-speakers - That would be someone ideally placed to greatly improve the quality of the English manual.

I have quite a lot of experience with translation of technical documents between English and Arabic (with other people translating - not me) and the translator really has to know the SUBJECT well - a regular "translation company" will always make a "dog's breakfast" when translating technical documents if they do not really understand the subject matter.

Once you have it in English, other languages would be easy!

Stu

Try rebooting and then hooking up the cable after the system comes fully up.
That usually solves my problem. (Win 7, 64 bit). Might work.

Hi,
> I have a KG-UV2D that is causing me problems when I try to use the USB cable.
I run win 7 ultimate on my PC the software and driver are installed and
recognized but I get a "connection failed" message every time I try to read the
radio. When I run a diagnostic it shows "device working properly" on comm port
10-----but when I click the comm port button it shows an unchecked #3 in bold
and the rest of the numbers are greyed out.

It's all on Wouxun's web site (the real web site, not the wouxun.US one).

For example:
Wouxun KG-816 Manual, Page 50
http://www.wouxun.com/DownView.asp?ID=8&SortID=24
++++++++++++
Inspection, monitor, stun, kill
Inspection:
Manager can use this function when he/she want to know whether their staff are on the working; manager send the inspection signal, and the member's transceiver in the group will reply to the manager automatically(what it replied is the ANI ID CODE).
Stun:
Manager can use this function when he/she only want to let their member receive and can't transmit. Manager only need to stun the member's radio and after this over, to activate it through transmit the power on signal when needed.
Kill:
When the radio was lost or other special circumstance happened,in order to let others disable to transmit and receive ,manager can use this function to kill the radio.
Monitor:
Manager can use this function when he/she want to know what their staff are doing at the moment. When manager transmit the monitor signal, the member's transceiver in the group will transmit automatically, then manager can hear the member's voice."
++++++++++++

On page 51 there is a screenshot of the KG-816 programming/configuration software (KG-8161.12.exe).

..
Principally, I thought the manual was reasonably good, but a couple sections, like the one shown above, is utterly confusing and really "downgrades" this really great single-band radio! If only someone could offer the 222MHz version of this thing... (min. quantity 100... too many for a potential group buy...)

Using so-called "railroad diagrams", the way they are now increasingly used for software development (software training, manuals, etc.), reduces the amount of text. This not only feeds towards a quick 'visual' learning/understanding of the material (menus, etc.), but also significantly reduces the translation effort required.

Having messed with technical translations before (from English into other, not doing that again ever if I can help it), I can not stress enough that a professional translator, or better yet, a translation company (such as www.allegro-translations.com) is needed here. As has been mentioned in a previous post, playing with radios for a hobby and being a native English speaker is far from enough for a truly professional appearance of such critical material. A graphic designer and typographer will add the finishing touches.
A.

Some other device, likely a modem, may be using the com port that the software wants. Try uninstalling any modems, then plugging in the cable, let the drivers install it, and then reinstall the modem.

I have experienced the same problem with my Win 7. For me (with 4 usb ports on the front of the machine) I moved the plug to a different usb socket and within 1 or 2 changes I got a successful read and corresponding upload. Worht a try if you've not already done.

Plugging the cable into different USB ports will cause the driver to assign different COM ports to it - you may find one that matches up to what the software wants. If so, continue to use that USB port.

Win7 is hokey... I posted a link that solved my problems.... Win7 likes to assign com ports and ports to everything, then "lose" then when you unplug. I have found a lot of hidden ports. If you wipe out all the hidden ports, it makes life a lot easier.. not just with what we need them for; but a lot of stuff. If you follow these instructions, you will see a TON of unused ports.

Go to

Start>Control Panel>System>Device Manager

Then in the view tab enable the view hidden devices.

Start removing all com ports that are not active. (Don't yank COM1, although the computer will reinstall that port)

Reboot and try again... I bet it will work.

I can't find the link with the dos and don'ts; but try if you've a mind to.... I found about 15 com ports.... I killed off 14 of them. Windows when it sees a device, it creates a port number and many times does not close ports after they are done being used.. the numbers increment each time, and pretty soon... your device can't find a port it likes.

I keep my programming cable plugged in all the time now. I run a hub to make sure stuff registered to a port doesn't get lost.

Keisha
  There is some videos on you tube that help like http://www.youtube.com/watch?v=pSfKsR7OdRs&feature=related these videos are home made so not great but a cleaned up video like them would be good. They help a lot I could program my radio right a way with its help. As for the blind ham I know of one retailer that has been trying to get the talking to be more useful to the blind. The owner of http://www.palmettoantennas.com/index.html is a teacher of industrial arts to the blind he has many students that get the license. One of his old students is a local ham now and wants to get a new radio but holds off hoping the speech will get more involved for blind users. By what I was told they will work on the speak for him if he orders a lot of radios but this would be a good thing for all dealers to have not just one. Remember when rewriting the manual try to right it so a 8 year old can read it this is the standard used by the news papers it makes it easy
for all to under stand even new hams.
Dana

Dear all,

Some blind ham friends emailed us that they suggested us recording a demo of KG-UVD1P about its features and basic operations. Some hams also suggest that we do a video for the programming guide so that some freshmen can easily do the programming.It is quite valuable and we are taking it into our consideration.

Can anyone, who are experienced in this give me some guide?

Keisha

3333. Re: [Wouxun_KG-UVD1] Re: "Inspection, monitor, stun, kill and emergency"

From: David A. Behar
Topic: 3294 Message: 3333

Hi Keisha,

Suggested English words:
a.. Inspection: "Poll"
b.. Kill: "Kill" is a good word -- it is used by other radio manufacturers
c.. Monitor: "Monitor" is a good word
d.. Stun: "Stun" is a good word -- it is used by other radio manufacturers
A very good strategy for finding English names for radio features is to look at the user manuals for the brand leaders in the U.S. market. For example, look at the user manuals for two-way radios from Motorola, Icom, and other suppliers to the U.S. market.

Study the manuals and other documents at http://www.icomamerica.com/en/downloads/, and you will see good ways to describe operations and you will see good names for features.

David

Subject: [Wouxun_KG-UVD1] Re: "Inspection, monitor, stun, kill and emergency"

It's all on Wouxun's web site (the real web site, not the wouxun.US one).

For example:
Wouxun KG-816 Manual, Page 50
http://www.wouxun.com/DownView.asp?ID=8&SortID=24
++++++++++++
Inspection, monitor, stun, kill
Inspection:
Manager can use this function when he/she want to know whether their staff are on the working; manager send the inspection signal, and the member's transceiver in the group will reply to the manager automatically(what it replied is the ANI ID CODE).
Stun:
Manager can use this function when he/she only want to let their member receive and can't transmit. Manager only need to stun the member's radio and after this over, to activate it through transmit the power on signal when needed.
Kill:
When the radio was lost or other special circumstance happened,in order to let others disable to transmit and receive ,manager can use this function to kill the radio.
Monitor:
Manager can use this function when he/she want to know what their staff are doing at the moment. When manager transmit the monitor signal, the member's transceiver in the group will transmit automatically, then manager can hear the member's voice."
++++++++++++

On page 51 there is a screenshot of the KG-816 programming/configuration software (KG-8161.12.exe).

..
Principally, I thought the manual was reasonably good, but a couple sections, like the one shown above, is utterly confusing and really "downgrades" this really great single-band radio! If only someone could offer the 222MHz version of this thing... (min. quantity 100... too many for a potential group buy...)

Using so-called "railroad diagrams", the way they are now increasingly used for software development (software training, manuals, etc.), reduces the amount of text. This not only feeds towards a quick 'visual' learning/understanding of the material (menus, etc.), but also significantly reduces the translation effort required.

Having messed with technical translations before (from English into other, not doing that again ever if I can help it), I can not stress enough that a professional translator, or better yet, a translation company (such as www.allegro-translations.com) is needed here. As has been mentioned in a previous post, playing with radios for a hobby and being a native English speaker is far from enough for a truly professional appearance of such critical material. A graphic designer and typographer will add the finishing touches.

From: kc5cqw
Topic: 3294 Message: 3334

Based on this example:

Inspection:
Manager can use this function when he/she wants to know whether their staffs radios are working; manager sends the inspection signal, and the member's transceivers within the group will reply to the managers request automatically(what it replied is the ANI
ID CODE).
Optional words to describe this feature: query, status, confirm

Stun:
Manager can use this function when he/she only want to let their member receive and can't transmit. Manager only need to stun the member's radio and after this over, to activate it through transmit the power on signal when needed.
Optional words/phases: group address, group announcement, priority, staff address, announcement, break, report

Kill:
When the radio was lost or other special circumstance happened,in order to let others disable to transmit and receive ,manager can use this function to kill the radio.
Optional words/phrases: disable, unit disable, ("self destruct" would be fun to use here but probably not a professional term),
brick (meaning: to render useless and become like a brick), lockdown

Monitor:
Manager can use this function when he/she want to know what their staff are doing at the moment. When manager transmit the monitor signal, the member's transceiver in the group will transmit automatically, then manager can hear the member's voice."
Note: "Monitor" actually works here but may be confused with the feature that "opens squelch" .
Optional words/phrases: stealth, stealth mode, listen, snoop, inquire, investigate, spy

This is just a start and i'm sure others in this forum can think of other terms to describe these features.

Hello,

Tks for all.
It seems that finding a person who is native English-speaker, and also experienced on the production is quite difficult. We are glad to know that everyone in this group are so enthusiastic to support us.

We have a thought that anyone can volunteer to share his/her wisdom on the original functions, and we will be responsible for summarizing this information.

Yet another rewrite.....

Inspection:
A manager can use this function when he/she wants to know whether a radio (or group of radios) is
working; A manager sends the inspection signal, and the transceiver(s) will reply to the
managers request by automatically sending the transceiver(s) ANI ID CODE.

Optional words to describe this feature: query, status, confirm operation.

Stun:
A manager can use this function to disable the transceivers TRANSMIT FUNCTION. The transceiver can still receive. Transmitting the Power On signal will restore transmit/receive operation.

Optional words/phases: None.

Kill:
A manager can use this function to completely disable the transceiver. If the transceiver is lost, stolen or other special circumstance has occurred.

Optional words/phrases: disable, unit disable , render inoperable.

Monitor:
A Manager can use this function when he/she wants to know what their staff are
doing at the moment. When a manager transmits the monitor signal, the transceiver will transmit automatically, then the manager can hear the surrounding area audio/voice.

Note: "Monitor" actually works here but may be confused with the feature that "opens squelch" .

Optional words/phrases: listen-in, snoop, inquire, investigate, spy.

or perhaps "Inspection" could be replaced by "Verification" or just 'Verify". Another possibility might be "Ping", which is used in computer net-working to describe a very similar function..

I must admit that I don't like "Stun" or "Kill", even if they are terms used by other manufacturers. In fact none of the original words conveyed anything to me until they were teased out by this thread.

To my mind, "Stun" suggests that the radio is rendered temporarily unusable for all functions. "Transmit Disable" would be more descriptive, maybe abbreviated to "T-Disable". Then "Kill" would be better described as "Disable Radio".

I agree that "Monitor" is capable of being confused with its other use, where it means to open the mute or squelch. Actually its use for that other function is a shame because it really is the best term to describe the function we are discussing but it is too late to change that now. In addition to Don's suggestions here we could use "Eves drop" or "Open Mic."

I agree, "stun" makes me think that I can use the radio as a self defense tool by means of a high voltage discharge. (I actually would like to see this feature BTW :-).

3342. About the "working with repeater"function

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-11-13 03:38:46 UTC
From: Keisha
Topic: 3342 Message: 3342

Hello,

Some users asked about the programming about working with the repeater funciton, i.e.,emergency repeater programming. On KG-UVD1P manual, the translation and instruction for this part is not detailed enough to guide.

Being a freshman of KG-UVD1P owner, what detailed steps for this programming can be advised? Anyone can help to revise it, about the pratical manual to program the repeater on KG-UVD1P radio?

Tks.

Keisha

Stu,

You are right.
We are working on the manual programming.
I received some emails asking about the programming on these functions, especially from the freshmen. The instructions on the original munual are given by our technician,then translated by others, so the guide is a little deep. That's why I want to ask for help, which the experienced owner can give us some output
accordingly for us to update on the manual.

I have two of these great radios, and enjoy them.
My question is from a new ham friend, who owns the single band as well as this radio.
Can you use the same software and programing cable for the single 2 meter radio the kg679p, as this one.
Perry

There is actually a model of amateur handheld radio being sold that has a stun gun built in, from China, on ebay, maybe it's the same manufacturer.
Now if only it had a " beam me up button"
:-)

One note, customer service has been very quick to respond to my questions by email, before I new this group was here.
Maybe the big three radio companies could take a lesson from wouxun, in how to treat customers.
Perry.

Hi Perry

It is my understanding that all accessory will work with most all Wouxun

Radios. The software may be a different issue.

Good luck.

Camilo.

The tx file is opened from the radio programming software.
When you have the initial programming screen open, you can go to the command menu at the top of the screen and go [File] [Open] and select the tw file you wish to open or you can click the typical [Open] icon right under the command line and do the same process.

It first helps to know where on your computer the tw file is saved. You can find that by going to [Start] and [Explore] and do a search for a .tw file.

Good luck.

Ed

3360. APRS + Wouxun + Android

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-11-16 08:04:20 UTC
From: Dinesh
Topic: 3360 Message: 3360

Hi Everyone,

I was wondering if I could use my KG-UVD1P along with my Android phone with the APRSdroid app installed. For those of you who haven't see what this application does here is a brief summary:
The APRSdroid is a free app for all Android based phones using which I can update my location using the phone's built in GPS and my location data then gets pushed to the APRS-IS network.
https://github.com/ge0rg/aprsdroid/wiki

What I would like to know is if I can set up the APRS voice alert on my Wouxun as described here: http://www.aprs.org/VoiceAlert3.html

I am an very new to ham radio and got my general license just a few months back and my Wouxun about a month ago. So I am still experimenting. Any help in simplifying the above Voice Alert procedure would be really helpful.

Topic: 3361 Message: 3361

Hello everyone,

I was wondering if there are any Mac apps for programming my Wouxun. I just know of the command line interface. But I am interested in a GUI app. Is there one? It is such a pain to boot into Windows everything I want to program my radio.

The following Wouxun_KG-UVD1 poll is now closed. Here are the
final results:

POLL QUESTION: In the Group and files section you have seen the announcement of the new Wouxun-uv920R mobile rig expected to hit the market in 2011
Knowing what has been mentioned re features and your experience with the KG-UVD1 model at what price range would you be willing to buy this new rig?

CHOICES AND RESULTS
- $99--$149.00 US, 14 votes, 19.18%
- $150--$199.00 US, 38 votes, 52.05%
- $200-$249.00 US, 18 votes, 24.66%
- $250--$299.00 US, 3 votes, 4.11%
- $300 up, 0 votes, 0.00%

If clearing your temp files/flushing your dns (click on start/run then type cmd & in the black box type "ipconfig /flushdns") if that don't work, then possibly it is your isp, had a website at work which nobody could access, the website had changed it's ip address, but the Domain Name Server of our isp had not updated.

Ended up convincing them to do a refresh of their DNS & it came good.

Bob
If you get a security warning you might have malware on your computer. Malware is not spy ware or virus so some software will not fix it. I use malware bytes I just had to run it on my wife's friends computer so she could get on here on-line school site again to do home work.

My thanks to Jerry and to all who tried to help with this weird problem. The bottom line is that a simple re-boot of both my cable modem and my router seems to have cleared up the problem. Took a while to get around to that obvious fix.

I can now access the wouxun.us site with no problem.

Again, thanks to all.

That's nothing I use it in my car factor antenna working a repeater 30 miles away. Repeater is up 290 feet on tower that's on a hill but also worked one about50 miles with after market antenna out the sun roof. I was on a hill and had some noise but could get in if I pulled over.

Hi friends,

I also get great performance with my Wouxun KG-UVD1P.

I have worked Doug on NA1SS on VHF four different times, using the Wouxn going to a quarter-wave mag-mount antenna on the roof of my car. I'm not sure of the exact range (he was mobile and traveling at about 17,000 mph), but he was likely over 500 miles away during at least some of the contacts.

I expect contact would have also been possible using just the handheld radio and the stock antenna, especially if the radio were to be oriented for best reception.

David

I have had so many Sat. contacts, I have had to actually order QSL
cards. I use an aftermarket antenna, and am ready to dty the stock
antenna for "bird work" I haven't been too lucky lately, 'cuz a "good
pass" and my free time lately haven't coincided.

I've logged into the RS0ISS-11 BBS on packet; but have yet to work the
Colonel. This is, of course, a goal of mine :)

They are really great radios, considering they can put a signal into space
:)

I'm glad now it's a competition to see how well our Wouxuns work :)

Definitely a plus for the newcomer wanting an inexpensive... but OH SO
WELL performer!

73 all :) Who has the record contact :)

3395. Working the International Space Station

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-11-17 22:59:02 UTC
From: David A. Behar
Topic: 3385 Message: 3395

Hi John and friends,

I've been surprised at how consistently I've been able to work the ISS. In fact, I think that with my Wouxun radio and a quarter-wave mag-mount on the roof of a car, I've usually been able to work him when I've been able to hear him. Here are a few clues on successfully working ISS.

Clue #1: Use a website like http://www.heavens-above.com to know when ISS will be in range.

Clue #2: Listen on the ISS packet frequency of 145.825 mHz. If you hear packet than Col. Wheelock is probably NOT on the air, because (I understand) that packet is left on when Col. Wheelock is not making FM contacts.

Clue #3: Look at http://www.issfanclub.com/, where people report ISS contacts on a timely basis. This lets you know when Col. Wheelock is on the air. For example, the website states that a contact was reported just a few minutes ago on the S. Atlantic seaboard. I'm guessing that if the station is active at the beginning of U.S. pass Col. Wheelock will stay active for the entire pass, since at 17,000 mph it takes perhaps 15 minutes to zoom across the U.S. Active reports are also tweeted to "twitter.com/rs0iss".

Clue #4: Note that the work day on the ISS is usually based on UTC, so a good idea is to listen during passes between 1800 and 2400 UTC. Also, I think they have one day mostly

Clue #5: Look at Col. Wheelock's work schedule, which is posted http://www.nasa.gov/mission_pages/station/timelines/index.html. Col. Wheelock is identified as "CDR". You can see from the link for today's schedule (http://www.nasa.gov/pdf/500438main_111710_tl.pdf) that the last scheduled item for CDR finished at 2130 UTC, and that starting at 2130 is "SLEEP". But like many amateurs, what is supposed to be "sleep time" ends up being "play on the radio" time.

Clue #6: People use different strategies for actually calling, but what I do is wait until I hear him come back to another station; then I wait five seconds; then I say something like "KILO SEVEN DELTA BRAVO, SPOKANE, WASHINGTON", speaking slowly and clearly. I then pause for about three seconds to see if he comes back to me (or anybody), and then I repeat the cycle. It usually results in a contact. Sometimes he just gets part of the call at first, and sometimes he comes back to the Spokane station, but I get the contact.

Bottom line: if you are somewhere where the ISS passes within range of your location and you plan your attempts, I expect you can be successful contacting ISS. The ARRL takes care of QSL card duties, and you will get your card in just a few weeks if you send a QSL and an SASE. I encourage all hams to give it a try!

Hi friends,

I've posted audio from two of my International Space Station contacts in the Files section in the K7DB folder, so you can hear my winning technique :)

Both contacts are made with the KG-UVD1P feeding a mag-mount 19" whip on the roof of the car. I expect just using the stock antenna would work fine if you orient the antenna for best reception (which should be with the antenna approximately broadside to where the space station is orbiting).

David

I use VLC media player, from the discription of the player, it will pretty much play ANY audio or video file that you can find, it even plays damaged and corrupt audio and video files. It also converts between file formats too. best of all it is free!

Is the KG-UVD1 certified for part 90 150 Mhz and 450/460 MHz?

I wish I had a radio like this years ago.
I used to have to carry 2 HTs.
One for 460 police and one for 154/155 Fire and EMS.
Two Motorola HT-220s can get awful heavy after a while.

I think this HT is going to become popular with suburban public safety agencies.

Even trunking radios could eventually a thing of the past.
Here in Michigan in Oakland County we have switched to the Open Sky system
and no system can receive it. It may take years but since Harris
Corporation has taken it over it has improved by leaps and bounds and there will be a
push to make it nation wide. Just speculation but we all need to prepare
for such a thing to happen.
We do not need every radio put in the Amateur market to receive public
service broadcasts or for that matter to receive trucking digital
communications.
As for the Wouxun handheld I own I would not trade it for the world.
It has been the most dependable HT I have came across yet as for the price
I commend Wouxun for making a low cost dependable unit such as my KG-UV2D.
May be big boys in the market should take a hint.
I eagerly look forward to see what Wouxun comes out with next.
Last but not least Thank you Wouxun corp. for a great radio,and to ED for
making them available.

What exactly is Open Sky? Wikipedia lists it as a voice-over-ip over the
radio but is it really? Seems like a mistake to me to include the overhead
of tcp/ip for something like this. Is it just a digital voice codec with
it's own proprietary protocol? (like every thing else out there)

Google isn't being very helpful besides leading me to a bunch of people
talking about how the system isn't very good:
http://www.centralpafire.com/forum/showthread.php?4627-another-reason-why-quot-Open-Sky-quot-is-a-mistake

<http://www.centralpafire.com/forum/showthread.php?4627-another-reason-why-quot-Open-Sky-quot-is-a-mistake>I
haven't found any details of it besides the scant few on wikipedia.

From what I can see, OpenSky looks like a great idea to combine radio and the internet to provide area-wide interoperable communication, but it is NOT the kind of system you want to rely on in an emergency. When the power goes, and the phones go down or are overloaded, there goes your OpenSky coverage via the internet. Or did I miss something here?

Radio, whether Public Service band or Amateur Radio, is the only 100% reliable communication in emergency conditions. 9/11, Katrina, and the Haitian earthquake made that quite clear. Inter-interoperability remains a problem, but this does not appear to be a solution.

I think we all agree that the Wouxuns have been a Godsend to
the hobby and to many others who require this type of radio. I
wonder if anyone has opened one up and taken photos of the
guts and posted the photos to look at? (If anyone knows of such,
please post the URL.) I'm curious to see the build quality of the
inside.

3432. Programming Question from a Newbie

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-11-19 04:38:19 UTC
From: bushie39
Topic: 3432 Message: 3432

Apologies for a long 1st post.

I'm considering purchase of a UVD1P that will be used for mobile use with the 477MHz UHF CB band in Australia, and recommending them to some friends.

I hope the experienced users here can help with some questions related to programming for this use and particularly for the channels that can be used here for repeaters.

The issues that are causing me a problem are:

We have a convention that uses 'Simplex' when the same frequency is used for TX & Rx, and 'Duplex' when 2 different frequencies are used for repeater input and output (I believe in some other countries this is called 'Talk Around' and may be called something else in some other countries). The UHF CB rigs sold here have a 'Duplex' button for when they are used with repeaters.

Only Duplex mode is allowed when within range of a repeater, but the repeater in/out frequencies can be used as simplex channels when out of repeater range (most often in my case).

The existing frequencies for CB channels 1 to 40 can be simplex, but within range of a repeater channels 1 to 8 must be used in duplex mode.

Taking channel 1 for example; in simplex mode Rx & Tx are both 476.425 MHz, but in duplex mode Rx is 476.425 MHz & Tx is 477.175 MHz.

From January 1st, 2011 UHF here is moving to narrow band and the CB band will be allocated extra channels from 41 to 80. Again frequencies for channels 41 to 48 are simplex, or repeater output.

When I program my Icom mobile rig for this usage, each channel is assigned an Rx frequency, and only 1 to 8 and 41 to 48 are assigned Tx frequencies (the Tx column is left blank for all other channels). Then while in simplex mode the Tx frequency is the same as for Rx, and the programmed Tx frequency is only used when operating in duplex mode.

Is it possible to program the UVD1P in a similar way i.e. leave Tx column blank and set the offset to 0.750MHz, then use it by switching between with/without offset as required for repeater use?

I'm also unsure if offset can be used with saved channels!

I know I can work around this by programming the 1st 80 channels with the Rx & Tx same value to represent simplex mode and add channels 81 to 96 with Tx offset from Rx. I would be happy enough with that, but I would like to not have to explain this complication for others less technical to work with.

I would be happy to not use channels 1 to 8 and 41 to 48 in simplex mode, but I lead trips into remote deserts and need to scan the available channels to know if another group is

nearby before having a head-on collision on top of a sand dune. If I hear someone using say channel 1 in simplex mode I will want to call them and let them know where I am.

Thanks in advance.
John

Hi John & welcome to the group, I have my Puxing UHF Handheld(similar to Wouxun handheld, uses same accessories etc) setup with the 1st 40 channels simplex, then 41-48 duplex & this is the convention for 99% of modern radios, the "duplex" button is pretty well obsolete these days.

On another KG-UVD1 group there is a data file for programming the new Aussie UHF CB 12.5khz frequencies...

There is a repeater reverse button on the Wouxun which enables you to talk on the output & listen on the input of a repeater...

I keep my Wouxun almost exclusively for Amateur radio use, but I do have channel 40 & a couple of others in there just in case :)

I haven't actually tried some of the approaches you raise John, simply because it is so eass to program the required receive and transmit frequencies in memory locations.

This also has the advantage of letting you use any frequency offset, rather than just the one selected using the offset function. In many of these rigs, although I'm not sure about the Wouxon, whatever offset is chosen using that function gets applied to all frequencies punched in. I use mine on the amateur 2 meter band, the 70 cms amateur band, the marine band and the UHF CB band, each having very different repeater offsets, so being able to use all of them in the one radio is important.

Certainly the software does not provide for an offset frequency as such for each memory channel, but it does let you set the receive and transmit frequency for each. The radio is quite happy if these are the same frequency, thereby giving you the simplex function you describe. It is equally happy if you program different frequencies for receive and transmit, "duplex" as we know it.

I can see that this could be confusing to some of your tour members but perhaps making use of the alphanumeric label for each channel can help overcome some of that? Additionally, I imagine that part of the leader's task would be to establish the communication channel to be used in each locale and then ensuring that all tour members are on that channel?

I guess there is also some safety consideration built into the repeater channel assignments. Even if you are on simplex on CH1 anybody within immediate range but using duplex is going to hear any transmission you make, as it will also be on the output frequency of the CH1 repeater. You will hear any transmission they make, even though they are transmitting on 477.175 (CH31?) because the repeater will re-transmit it on channel 1.

Why do so many people see the word Internet and believe everything goes down? The Internet Protocol can run between 2 device or millions of devices. You can run VOIP between two radios through a repeater, or across radio links, microwave trunks, or wire, or fiber, or sometimes even satellite. It's just a transport. Don't think public safety might spend a little money to harden their IP transport and have multiple paths for it to travel?

Loss of "the Internet" is usually very local and can be routed around. You loose the fiber bundle, drive over to the EOC with a Ubiquiti bullet (or better) and point a couple of miles down the road to where there is connectivity.

Even during Katrina there was an ISP down in the heavy flooded areas that kept on going.

Radio gives you portability and except for very remote areas you can probably get to an IP point with Microwave (Radio) in one or two hops.

For the UVD1's I set up for the RFS i set 1-80 as simplex channels and then we use 81-89 as the the repeater splits sa,e as most commerical radio get programmed as when used on UHF CB radio.
As to the 80 channel radio plan it still has not been official approved and written into law yet and is still as the planned band plan. There was some delays getting CB manufactures making radios to meet the new rules into time for the propose change over, GME was not happy abut the channel numbering but this has now been fixed.

The biggest problem will be people who will insist on use the old wide band radios which wil the cause splatter for anybody using the new narrow band radio and channels.

Tim,

The repeater is about 40 miles from my home QTH (halfway up a broadcasting mast) and I work it 5/9 with a dual-band vertical (5/8 on 2m) about 10 feet above ground. I can copy the repeater (scratchy) from the stock antenna in the garden below, but can't really get in.

When mobile I can work the repeater up to about 50 miles further away with the usual dual-band mag-mount (again, 5/8 on 2m).

Stu

Does anyone know of a Hong Kong dealer that sells the KG-703E? I know both Ed's can get it, but the price is about the same as a KG-UVD1P because of it being a small order and the extra overhead a US dealer must pass on. It would be much easier for me to buy this radio to try at say $80 versus $130 or so shipped. I would also be interested in any other VHF radios that have a display and limited keypad, as this is ideal for my use.

3460. Anyone have a 2M/220 file for the Saginaw/Midland Michigan area?

Going to be visiting over Thanksgiving. If anyone already has a 2m/220
TW file for this area, would you please post it or e-mail it to me directly
off-list?

Thanks, -WY3X

Well, I guess since everyone is throwing the # of groups they own/moderate, I will chime in and say that while I don't own or moderate any groups, I do work for Yahoo!

I am sure the list owner has it under control (Moderate!, Moderate!, Moderate!).

From: Dan
Topic: 3464 Message: 3464

I have a KG-UVD1P.

I am programming it using the Wouxun USB cable and Wouxun's
KG-UVDPv2.0 software, on a laptop running Win7 Professional.
When programming frequencies, the software will not allow me to:
Control-C to copy a line,
Control X, to erase a line but hold the contents in a buffer,
Control V to paste a line,
Insert a line or
Delete a whole lin.

I have found that I can clear the data on a whole line by Clicking on the RX frequency box, hitting "DELETE", and then hitting "TAB". As soon as I hit "TAB" all the rest of the data on the line is erased.

Is there some other way to perform these functions, while running the KG-UVDPv2.0 Software?

Also, I see that you can change the power on message to one of three preset Messages:
Welcome, Battery, or total screen.
Is there any way to program other Power on messages?

Dan

I'm afraid the software doesn't seem to work like most WinDoze programs.

Cut and Past doesn't work, neither is there a facility to add a line "below" as you can with Word or Excel.

Sorry, but the options you mention are the only available power-on messages (although I have heard that the UVD2 is more versatile there - although that and the "copper" finish is about the only changes from what I understand!)

There is a program that has been posted in the files section here that is a bit more flexible and allows better handling of the "tw" files (I think it converts then to Excel and back, and also allows spaces in the channel names??) - have a look around.

Stu

You can also erase the whole line by clicking on any other RX Freq box.

To cut and paste, right-click on the Channel Number choose "cut", then right-click on some other Channel Number and choose "paste".

Go to this link and download the TWEDIT file- I allows you to import a .tw file into Excel, modify it and export to modified .tw file.

I got it to cut and paste easily. At first it wouldn't then for some reason it worked after a few tries. Remember it's only 128 memories, so I have it almost full. Don't put in frequencies/repeaters you can't easily access or you will waste memory space that could be used for what you can hit.

I have gone to the FILES section of this NG.

I have tried to download and use TwEd.xls.
I can get the file open as a spreadshete in Excel 2203 ok, But the instruction box on the spreadsheet says to go to :Analysis ToolPak-see Tools/Adins.

I can't find Tools/Addins on the spreadsheet or in the Excel toolbar.
Also I cant find instructions on how to turn the XL spreadsheet into a
.tw file for downloading to a KG-UVD1P.

Is there a more detailed set of instructions somewhere else?
Or am I just overlooking something?

Can't help you on the Tools question unless maybe you need to go to Tools/Options/Macro Security first and lower your security level. The Add-on worked OK for me. Make sure you enable macros when the spreadsheet opens.

As far as saving your new/updated spreadsheet back to a .tw file, that's what the "Write" box on the User Input tab does. Just put your entire filename including the path into the cell next to it.

From: bushie39
Topic: 3464 Message: 3478

The Analysis ToolPak is an Excel module that is not installed by default - it is one of several modules that can be selected for installation when Excel is first installed.

If it was installed then it will be found down near the bottom of the Tools menu of Excel under Add-ins. In my version of Excel (2000) when you select Add-ins a window pops up and you can then check Analysis ToolPak.

If it was not installed then you have to go back to the installation CD for Excel and install it from there.

As other have said you need to enable macros for Excel.

When you load the TwEd.xls spreadsheet, there are some instructions on the sheet named INSTRUCTIONS.

The only sheet where you input data or make any changes is the one named User Input.

At the top of this page you have to fill in cells F1 & F2 with the complete path and name for the .TW files that you want to input and output.

After telling Excel the file to load (in cell F1), you then press the READ button at cell C1.

After you finish making changes and want to create the new .TW file the you have selected (in cell F2), you then press the WRITE button at cell C2.

Hope that helps.

John

Hi group im trying to set up my kg-uvd1p for packet using agwpe. I can send packets out fine but no matter what i set the volume to this radio will just not decode anything. Tried it on another radio and that decodes just fine.

Is there some very heavy audio filttering going on stopping successfull decodes.

Any help is much appreciated as i know others are using theres happily for this purpose. Many thanks in advance.

Well the radio should not decode anything so that part is all ok– the software on the computer should be doing the decoding work.

Hi Hi yeah the software is doing the decoding just fine but only with audio from other radios not the kg-uvd1p. Just wondering if others had it working out the box or if i need to modify the audio out as best results come from radios with a disriminator tap.

Surely it is the Terminal Node Controller (TNC) that does the encoding / decoding, the computer is only there to make logical in[put and output of the data....

Well the radio should not decode anything so that part is all ok– the software on the computer should be doing the decoding work.

Subject: [Wouxun_KG-UVD1] Packet via souncard

Hi group im trying to set up my kg-uvd1p for packet using agwpe. I can send packets out fine but no matter what i set the volume to this radio will just not decode anything. Tried it on another radio and that decodes just fine.

Is there some very heavy audio filttering going on stopping successfull decodes.

Any help is much appreciated as i know others are using theres happily for this purpose. Many thanks in advance.

The TNC converts the audio tones from the radio into "ones and twos" and inserts them into a data stream (and possibly adds the parity etc, though I think that is already in the received audio) that feeds the RS232 into the computer, that then (according to the display software used) displays them on the screen.

(and vice-versa in the other direction)

Hi Mark

The sound card decoder you mentioned (agwpe).has some links to setup tools

I had a quick look at this. There is a oscilloscope app. (with sample waveforms) to compare the received audio.

Have you looked at the waveform from the kg-uvd1p yet,

Also have you looked at the waveform from a radio that is passing audio that the sound card can process?

At least this will prove if kg-uvd1p is filtering the audio to the point where it cannot distinguish between the mark - space (one's - zeros)

Hope this helps

Thanks for the reply to this. Using my other radio with the tools shows a lovely flat trace. Using the kg-uvd1p i have a very sharp spike outside the high tone and dropping very low for the low tone. Using the osilliscope in the tools the high tone starts going through but then the error occurs in the low tone so im assuming there being filtered out and to low to get any kind of successful decode.

Shame as its a great radio with great sensitivity and would made a great little handy to use on APRS. Not parting with it though as it really comes into its own on moutain top activations with just the supplied antenna.

Thamks to all that tried to help me out with this.

A pity - I was intending to have the option to use mine in the same way. Maybe a series capacitor and the volume set high might improve the low tone comparatively? The scope tool should give you an idea if you try to adjust the cap and the volume go get results as near as possible to the other radio.

I have not used a KG-UVD1 for packet or been able to find a web reference to someone wou has.

http://dp.nonoo.hu/about/my-aprs-stuff/ is a page about someone who runs an APRS IGATE using a Wouxun KG-689 ($74.50 at www.409shop.com).

Just a thought:
using wide-band modulation?
Receive and transmit PL Tones/DCS are off?

Could it simply be that you have not wired the plug up correctly to the radio ?

Hi All,

I have the same problem,

I use the USB drivers off the web site on my Win XP-SP3 box and the Win XP-SP3 laptop with no problems but I now have a netbook with Win 7 Starter OS and it will not let me fully install the USB drivers as windows 7 protection has problems with the install software.

I had no problem installing drivers for my USB to RS232 lead that I use for my scanner programming.

I suspect the Wouxun USB drivers are not fully Win7 compliant yet.

cheers, OldOne

When you got the the USB programming lead did you get a disk with it that has the driver for that cable? It will need it to work before the computer will see it.

If you have any other USB driven cable that you use and have already installed, you won't need to download or install any new drivers. I use several different USB cables for different devices and the same USB driver works on every single one of them. It's really not necessary to load up 10 different drivers. First plug the cable in and if it asks to install it, choose automatically. It should do it in due time. After it's done searching for and installing the needed driver, you won't need to do much of anything else, except connect your cable and radio and have at it.

I have a Kg-UVD1P- Great radio except for Scan. Suggest you offer a better Scan capability.
1. Mode 1- When in Scan mode, allow Transmit on Priority Channel and Continue Scan after transmit is complete.
2. Mode 2- When in Scan mode, automatically Transmit on last active scanned channel if PTT is keyed within say 3 seconds- this is called Talk Back in some radios. Then resume Scan.

I use these features in Motorola and Kenwood Commercial radios and they are necessary in any radio we purchase.

"Mode 1" - I'd rather stay on the !last transmitted" frequency for at least a short time - otherwise any reply to your transmission may not be received until the scan next comes to that frequency (?)

"Mode 2" - I would like something like this, but I'd like the TX to stay on this frequency until you hit the A/B or the button again. Otherwise you could have the same problem with the RX wandering off after you had transmitted.

I like the "scan stop" that we have if you hit PTT when an "interesting QSO" stops the scan, but I'm still (after 8 or 9 months owning at least one UVD1) unsure of the logic behind the "dual watch".If you are listening on priority channel and something comes up on the secondary, it seems to sometimes switch and sometimes not - is this dependent on signal strength?

Remember, the reason we have these is cost and features. We can nickle and dime ourselves up to Motorola price in no time if we get feature rich. I have a Moto UHF on a shelf that is a nightmare to program because of all the options. I like the Nuisance Channel lock out that will kill a channel from scan if the traffic is annoying. This 32 channel single band cost twice used what a new UVD cost new!

As I understand it there is a limit to the number of letters available for a memory name. Has anyone found a way to extend this allocation of letters / numbers, or found a character that can be used to separate digits?

I find I could do with a few more characters to fit in repeater names etc.

thanks Andy

What's wrong with using the repeater callsign?

If you are traveling and are not familiar with the new QTH repeaters, things might get confusing. I am planning a trip to Alaska next year and plan on pre-programming some of the local repeaters. Quickly knowing vhf/uhf/echolink/irlp would be veryhandy.

You are stuck with six characters and no spaces. However the software for the UV3D will allow you to insert a hyphen which appears as a space. I use this on several UVD1 & 1P's. Don't change the power up announcement but it seems to work on the older radios without problem.

From: gunterkonig
Topic: 3516 Message: 3516

Hi everybody,

i just got my UVD2 radio today and trying to program it with the 2.0 software. I have managed to change the channel display way to channel number and name. After uploading the radio switches to channel mode and displays the channel number and name. But: Switching back to frequency mode and back to channel mode changes the display to CH - XXX where XXX is the channel number. The name is not displayed anymore.....
Any hints on that ? When i read the radio settings again the channel display name is changed to channel only.
am i doing something wrong here ? My radio has firmware J11.
Should i use another programming software ?

I dont understand the chinglisch manual at all... can anybody out there explain with his own words how to change from frequency mode to channel (is it memory ?) mode and what is the reason behind ?

Thanks and best regards

Joachim

3517. Instructions for Unlocking the Wouxun KG-UVD1 - Where's it posted?

my UV2D is fine, in fact so far I've not experienced any problems at all. Maybe your unlucky and have received a Friday?

I'd try a cold start and see if it helps, be sure to backup before you do.

Hi All,

I may have missed some of the conversation regarding packet reception due to slightly over-excited deleting of emails, so bear with me if this has already been suggested...

Has anyone tried installing a discriminator tap into the KG-UVD1. Granted, it requires drilling holes and soldering a couple of components onto a perfectly good radio, but I would hazard a guess that it would get around any decoding issues related to distortion, filtering and amplification in the audio output stages of the radio.

The website http://www.discriminator.nl/index-en.html may be of assistance.

Kind Regards,

Lee

Yes its a UV2D, at least it looks like from the outside. I also saw a QST review of the UV2D where they specifically mention that this problem was solved...
I have already tried a soft reset a couple of times, at least if oyu mean Menu 29. Maybe i should call the dealer and check if i got a friday radio ?
Who got the UV2D which is not showing that issue ?

Regards

Joachim

I had the same trouble and like most people having never read the instruction booklet, I was playing around with the radio and came upon MENU, 2, 1 up/down arrows and fixed mine immediately.....

The one I have is definitely a KG-UVD1p radio which works absolutely great.

It actually gets quite easy when you are used to it (like the 4th or 5th time)

I bought my XYL a UVD for passing her license exam and she likes to have hers on frequency mode while I like "name" (she's not learned to use repeaters yet!).

"Enter"
2, 1, Enter,
Down Arrow to select FREQ, CH or NAME
Enter

It gets easy! Until the complication of the XYL's rig came up, I used mine all the time in NAME mode, except when I needed to select an odd frequency (like tuning an antenna). I like it there.

I use MENU + TDR, as described.

If you have to do it in the menue.... Then i dont understand why people like this HT. The handling and manual programming is a pain in the a**. How can someone write a firmware like that ? .....

That statement reminds me of teaching a new student how to drive a "stick" shift vehicle. I dont understand why people like this car. The manual transmission is a pain in the a**. How can someone build a car likt? .....
Answer: It's all about getting used to something new . . . and great!

Hi Mark,

I recently bought a Wouxun KG-UV3D, and last night connected it to one of my TinyTrak3s with my HTKP Kenwood HT cable. The radio was able to transmit, and the data was received and decoded on both my Kenwood D710A and D7A. One note, however, was the the local RF was very strong, so I had to use an external antenna.

Next I connected the Wouxun into my TinyTrak4, adjusted the volume, and sent APRS packets back and forth between it and my D7A.

So, while it may be true that some of the Wouxun audio path is filtered, I did find the stock unit able to send and receive APRS packet via the mic/ear jacks. I was set for narrow deviation.

Hope that helps,
Byon

Ed,
in one way you are right. But: Common functions should be performed as easy as possible. Why they put rogerbeep on key #5 or voice on key #9 ? Nobody will ever know....and everybody will hardly change the rogerbeep or voice settings...

Btw: I have driven manual as well as automatic shift vehicles. Can you imagine you have to press 5 different buttons in a certain sequence to change from "P" to "D" ? Everybody would turn crazy....

Ok but maybe i have to get used to the different way of operate this ht...

I there an alignment mode menu or internal pot or some way to set the
low power level?
Mine puts out 2W and I would like to set it somwhere between 100mW to 500mW.

Tom

Mark,

If you're like me you will put your Kenwood aside in favor of the UVD1P.
I bought one at the recommendation of a ham friend. Loved itand decided to become a dealer for Wouxun I loved them so much. Yes, I sell other brands but now concentrate only on the Wouxun. I can't get any other radio with the functions and benefits this one has for the same price. It works perfectly and has great RX with the sizable speaker it has. The TX is hot with the good mic and I particularly like the stock antenna over other after-market ones. Why purchase what you don't need when you already have one designed for the radio and comes with the radio?

Put your K radio away for a week. You'll never go back.

I'm just going to elaborate a bit on the manual tranny aspect so this is a bit O.T. Please forgive me.

I am an avid lover of the Model A Ford. I own two now (had 3 but a cop wanted to buy it and I couldn't turn down his offer). I had Model A Fords since 1960 when I had three back then also. Anyway, I often show my car(s) and at shows you often see even older cars like the Model T which is yet another challenge to drive.

To start a Model A Ford, you turn the key on, press your left foot on the clutch, retard the spark with your left handle (looks like a turn signal lever), advance the throttle a bit (looks like a gear shift on the right side of steering column), with right hand reach over to passenger side and pull up the choke control, while stepping on the starter with your right foot. All these steps are with an electric start. I won't bore you with the crank start routine! Once it starts, you can adjust the carburetor with the choke control by turning it right or left. Now you can advance the spark with your left hand, release the brake on the floor, shift into first, lift up on clutch and drive.

These were some of the BEST vehicles on the road in the late 20s and early 30s (some claim they still are). All this is forgotten when we get used to no-key entry and no-key start with today's models. All the thrills cost money and things to go wrong. Back in the 30s there was no AAmco transmission shops. Trannys didn't go bad. The Wouxun has advanced technology but still has options that are manual in order to keep the cost down avoiding higher engineering and higher costs.

Enjoy your radio. It is a winner in 2010 and all the "majors" are looking out of the side of their eye at what's happening to the communications market. Think they're nervous? I do.

BTW, keep in mind this is NOT a ham radio. It is a professional BUSINESS radio and FCC Type accepted Part 90 not Part 97. Us hams just love to tinker and play with stuff and we found the Wouxun works great as a ham radio thus we deprive our commercial friends of them when we obtain them instead. Don't ya just luv it?

Hi ed love my wouxun to bits but had to go else where until they build a model with tnc and gps all built in so no extra bits of kit to carry around. Would highly recommend the 1700mah battery as i can get 2 days hill top use out the battery.

Mark,

If you're like me you will put your Kenwood aside in favor of the UVD1P.
I bought one at the recommendation of a ham friend. Loved itand decided to become a dealer for Wouxun I loved them so much. Yes, I sell other brands but now concentrate only on the Wouxun. I can't get any other radio with the functions and benefits this one has for the same price. It works perfectly and has great RX with the sizable speaker it has. The TX is hot with the good mic and I particularly like the stock antenna over other after-market ones. Why purchase what you don't need when you already have one designed for the radio and comes with the radio?

Put your K radio away for a week. You'll never go back.

Hi Mark,

I recently bought a Wouxun KG-UV3D, and last night connected it to one of my TinyTrak3s with my HTKP Kenwood HT cable. The radio was able to transmit, and the data was received and decoded on both my Kenwood D710A and D7A. One note, however, was the the local RF was

very strong, so I had to use an external antenna.

Next I connected the Wouxun into my TinyTrak4, adjusted the volume, and sent APRS packets back and forth between it and my D7A.

So, while it may be true that some of the Wouxun audio path is filtered, I did find the stock unit able to send and receive APRS packet via the mic/ear jacks. I was set for narrow deviation.

Hope that helps,
Byon

There is no wonder that the Chinese economy is booming. They produce great radio's etc like these and sell them cheap, hence lots of money in the cash register.

The other Japanese companies sell items more expensive, hence not so much money in the cash register.

Mind you, here in England, I suppose it is the same the whole world over really, the authorised agents put their huge markup onto the price, hence radio shops are not really that busy. I remember going to a certain radio shop in Matlock and whenever I went in with my pal, if the shop had more than 5 people in whilst we were there, it was doing well.....

I wonder what the profit markup is on the Wouxun. ?

If you have to have APRS, why not a PacCom HandyPacket - smaller than the Wouxon and you could rubber-band it or Velcro it. You want a GPS built in as well? For $100?

Just look what you are already getting for the money! A rig that's well built and performs like on that's 3 times the cost - even if the user manual is far from what it should be.

Like Ed, I looked at becoming a dealer but unfortunately our import taxes here make it difficult to pay tax and still leave something aside for after-sales service (according to my valuations).

Stu

First let me say that Ed is fantastic for these radios. I bought mine on Sunday and got it yesterday. I'm new to the hobby and understood that there were some programming quirks. I'm OK with that due to the price. I consider myself a smart guy who is naturally curious and likes to learn new things.

That being said, I also bought the programming cable.

If you want something that's push and go, you can have that, for a price. I think you'll see the bigger makers trying to better position themselves against the cheaper Chinese models.

> I am an avid lover of the Model A Ford. I own two now (had 3 but a cop wanted to buy it and I couldn't turn down his offer). I had Model A Fords since 1960 when I had three back then also. Anyway, I often show my car(s) and at shows you often see even older cars like the Model T which is yet another challenge to drive.
> Â
> To start a Model A Ford, you turn the key on, press your left foot on the clutch, retard the spark with your left handle (looks like a turn signal lever), advance the throttle a bit (looks like a gear shift on the right side of steering column), with right hand reach over to passenger side and pull up the choke control, while stepping on the starter with your right foot. All these steps are with an electric start. I won't bore you with the crank start routine! Once it starts, you can adjust the carburetor with the choke control by turning it right or left. Now you can advance the spark with your left hand, release the brake on the floor, shift into first, lift up on clutch and drive.
> Â
> These were some of the BEST vehicles on the road in the late 20s and early 30s (some claim they still are). All this is forgotten when we get used to no-key entry and no-key start withÂ today's models. All the thrills cost money and things to go wrong. Back in the 30s there was no AAmco transmission shops. Trannys didn't go bad. The Wouxun has advanced technology but still has options that are manual in order to keep the cost down avoiding higher engineering and higher costs.
> Â
> Enjoy your radio. It is a winner in 2010 and all the "majors" are looking out of the side of their eye at what's happening to the communications market. Think they're nervous? I do.
> Â
> BTW, keep in mind this is NOT a ham radio. It is a professional BUSINESS radio and FCC Type accepted Part 90 not Part 97. Us hams just love to tinker and play with stuff and we found the Wouxun works great as a ham radio thus we deprive our commercial friends of them when we obtain them instead.Â Don't ya just luv it?

Can anyone furnish me with a working .TW file for the UK 2m/70CM repeaters.

I travel from Australia to the UK often (today in fact), and would appreciate if some kind soul could save me heartache in finding tones, offsets bursts etc

Cheers,

Derek VK2YN dernel@...

It makes you wonder if there was a way to "scrape" the data from any of the NUMEROUS repeater listing sites and have it output into the right format....

Hi Michael,

yes i looked at that one, but beieve the UK repeaters have tone encode/decode and 1750hz tone bursts...

Will be staying in New malden and Windsor areas if this helps,

regards,

Derek VK2YN

Here's a not-so-elegant solution and requires the use of a GPS:

1) Use this site to find the location you are traveling to and export the data to CSV. The site is http://k5ehx.net/repeaters/ It does work with the UK.

<http://k5ehx.net/repeaters/>2) The use this site to convert the CSV to GPX. The site is http://garmin.gps-data-team.com/poi_manager.php

<http://garmin.gps-data-team.com/poi_manager.php>3) Load the GPX file into a program such as EasyGPS and send the waypoints to your GPS.

Now when using your GPS you can see the repeaters you are likely to be able to hit. The callsign, freq, and PL are listed in the waypoint name. You'd have to program each one on the fly. It's not perfect but it's something.

Thanks Eric,

Wow if i had the time..unfortunately a business trip, and wont be taking my 60CSx..

I am sure someone will come thriugh with a file.

if you need a Sydney one..i have one in the software section undere VK2YN

regards,

Derek

3546. Re: Memory name changs from CH + name to CH

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-12-03 01:38:01 UTC
From: Keisha
Topic: 3516 Message: 3546

Dear Joachim,

Could you double checked with the serial number? Since at the first beginning when KG-UV2D was come out,the channel name editing function was still not updated yet, which the NAME would be switched back to the default CH displaying AFTER the transceiver was temporarily switched to VFO in the NAME mode.

However, regaring to the current version of KG-UV2D,it is already updated that: even after being temporarily switched to VFO, then back to NAME mode, the transceiver will "remember" the NAME displaying but not the CH displaying.

The one in your hand may be the early version of KG-UV2D.
Hoping that you understand.

Keisha

Keisha,

yes it should be a new UV2D. According to the labels it was manufactured in November 2010 and serial number starts with J11. It also shows UV2D in the display and the reset is password protected. According to some messages here and there that should be the new software...
Anyhow, i have called the importer. He will check with one ht from his stock and i will call him in the afternoon.
Lets see the outcome..
Obviously there are different firmware versions floating around... But i think the new one should have the "errors" fixed....

Joachim

P.S: If you say switching between channel and frequency mode: Do you press MENU + TDR or you go with MENU 21 etc. ?

Dear Joachim,

The transceiver you got is the customized according to customer requirements, which the reset password and the channel name editing are different from the current version of wouxun KG-UV2D.

It is not the error fireware but the differentversion.

Nihao Keisha,

thanks for the interesting informations.
looks like you have some good and deep knowledge on Wouxun transceivers :-) I really appreciate that you follow this group.
Unfortunately one cannot update the firmware inside the transceiver..

Dont get me wrong: The UV2D is a nice little HT. I am satisfied with it, just the change between channel mode and frequency mode and the reset to CH -XXX sucks... Maybe in the next firmware version we can assign the PF1 key to have quick access to the channels ?

Best regards

Joachim

Under the Edit drop down for Optional Function select which of the 4 options you wish to display, then save the file to whatever you name the file, then upload it to the radio.

Clyde,
that also only worked once... I've also done it that way. Once you change via MENU + TDR from channel to frequency and back to channel voilà only CH-XXX

Hello all
Got my new to me KG-UVD1P yesterday and am loving it so far
The programing software is great
Do have some ?'s for ya tho
Is there no way to do a memory channel lock-out from the radio(only from software)?
also is there a way to not have the backlight on when scanning but still be able to turn it on?
thanks for the help.

I asked similar questions of the australian government and the response i got was because the radio does not have a one touch emergency channel button it was not allowed to be marketed as a VHF Marine radio. I'm sure there must have been other reasons as well.

I can see it not being sold as one just thought it would be nice to have one radio on the boat. I am only on inland water and don't have to have a radio at all but would take the HT if it can be used that way "legally" I might use it to monitor only this spring no need to buy a radio I don't have to have when cell phone or ham radio will work on the Mississippi River.

Joachim£¬good day,

The transceiver you got is special version as it is customerized.

Other current version is different in the channel name editing, which the transceiver can keep in NAME mode even being temporarily switched to VFO or resumed.

As I konw, there is no fireware to directly update your handy transceiver, because it is fixed on the PCB when it is manufactured.

It is an amazing idea that assign the side key PF1 to be selectable for the quick channel programming.:)

Derek ,
Sorry this is not quite the solution you hoped for, however if you access :

In Wouxun group Files > Frequency Lists/ RP-CHAN.tw there is the TW file for all of the repeater channels on 2m/70cm in the UK, which can then be customised using data for the local UK repeaters

To find the data for the local UK repeaters use <http://www.etcc.rsgb.org/ > this has both a Google map and a table showing the locations, frequencies, required CTSS etc. for access of the 144 and 433MHz repeaters.

Near (15mls) to Windsor is GB3AL, RV59, Amersham, output on 145.7375 Input 145.1375 requires 77Hz for CTCSS access

I colored mine black with a sharpie or magic marker. That dimmed it some
but it is still too bright.

I believe NONE of the 699E models have an FCC ID, and thus cannot be
used in the USA.

I tried to verify; but at this late hour the
FCC database isn't responding.

I want to change the function ! No light when scanning and light up at the found channel !
Is it possible to update any software to get this function ?
>

It most certainly would be possible to update the software to correct this operation. The problem is in the logic.

The software is currently set up to turn the backlight on every time something 'changes' and then turn it off again a short time afterwards. So if you push a button, that is considered a 'change', and the backlight comes on for a short time and you can see the results of your button push. Since you have initiated the action you are prepared to look at the screen and you have time to read the information before the backlight goes off.

During scanning, each change in frequency turns the backlight on. With no signal present the frequency updates again before the backlight times out and this new change in frequency resets the backlight timer. So as long as the radio is scanning the backlight stays on. If a signal is present then the radio stops scanning and after a few seconds, since there have been no more changes, the backlight goes off. Since you are probably doing something else while the radio was scanning you don't have time to shift your attention to the radio display before the backlight goes off.

So all that has to be done to correct the backlight operation is to have the change in frequency during a scan to NOT be considered a 'change' as far as the backlight logic is concerned. The opening of the squelch when a signal is present will then be the change that turns the backlight on. You may still not have time to shift your attention to the display but at least the backlight will come on only when it should, and it will be off when actually scanning.

Don

3581. Accessory Questions

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-12-06 20:20:41 UTC
From: RalphH
Topic: 3581 Message: 3581

My KG-UVD1P arrived. I purchased several accessories with it. My problem is that some of the power adaptors are not pictured along with the accessories, so i'm not sure what they are to be use for.

1. Is the wall wart for use with the drop in charger?
2. I have another AC to 12 power supply (looks like a laptop power supply). Its about 4 inches by 1 1/2 inches and puts out 3 amp max. Is this for use with the Eliminator?
3. I also have a 12 Vehicle power adapter (cigarette lighter), which I think plugs into the Eliminator. Am a correct on this guess?
4. I purchased the 1700 ah battery. When i put it in the charger, the main power light flashes from red to green. There is no indication on the Charge/full lights. The 1700 ah battery shows fully charged when i put it on the radio. When i charged the 1400 ah battery, I got indications on the charge / full lights. Is this normal for the larger battery?

Thanks
Rusty

Typical. You received a fully charged battery. You can use it now.

Sorry I can't answer your other questions. My chargers have no wall
wart type devices, just a straight AC cord. There are 3 models of chargers.

3583. 1750 Hz tone no longer working on KG-UVD1P

Date: 2010-12-07 01:56:15 UTC
From: oakwhiz
Topic: 3583 Message: 3583

When I first got my KG-UVD1P, the 1750Hz tone worked... I made a bunch of settings changes and unlocked the VFO. Now when I try it, it doesn't work.

It's not a critical feature... but it would come in handy.

Anyone else have this problem?

3584. Re: KG-UVD1P internal memory and firmware updates

Sorry to bump this topic after so long...

Thanks for that info on the protocol. I'm going to be looking into dumping the firmware... it would be really nice if an alternative firmware could be developed, with custom features. Remote control of the radio would be interesting as well, especially for autonomous APRS trackers.

--- In Wouxun_KG-UVD1@yahoogroups.com, "David A. Behar" <david271@...> wrote:
>
> Hi friends,
>
> I have analyzed the structure of the "tw" programming file, and I have also analyzed the communications protocol between a computer and the radio. I have also read the KG-UVD1P service manual. Based on that analysis, I believe (but can't be 100% certain) that it would be possible to perform a firmware update, even though I understand the company denies this. I will explain how I reached this conclusion.
>
> First, the communications protocol between a computer and the radio -- whether downloading programming to the radio or uploading programming from the radio -- consists almost totally of "Read" and "Write" commands. Each command includes a single letter (byte) -- "R" for Read and "W" for Write; and then a two-byte address; and then a length of the data block. For example, the data communications is usually 64 bytes at a time.
>
> When you download data to the radio, all you are downloading is 128 16-byte channel records for channels 1 to 128; 128 16-byte label records for channels 1 to 128; 2 16-byte channel records for VFO A and VFO B; and another 64 bytes of information for general radio settings.
>
> By the way, the program which reads and writes band limits for transmitting and receiving uses the identical protocol, and there is just a specific address in the radio memory where this information is stored.
>
> According the the service manual (mine is marked Model KG-UVD1P, Version KG-UVD1-0905-V1), on page 13, under the heading "VII Memorizer Circuit", we see the following text:
> The memorizer circuit is made up of CCPU (IC811) and EEPROM (U811).
>
> The capacitance is 64k bits, including the handset controlling program by CPU and the operation function data.
> Under this text appears a simple diagram showing a single CPU communicating with a single EEPROM.
>
> Note that the "64k bits" is 8k bytes. The radio programming information takes up a bit over 4k bytes (a 16-byte channel record and a 16-byte label record for 128 channels, plus just a bit more memory for other radio configuration information), leaving a bit less than

4k bytes for the radio control program. Note that the manual indicates that both the radio data and also the control program are stored in this single EEPROM.
>
> Since the radio-computer serial communications protocol seems to permit reading and writing to any address in the EEPROM, if a person were to know where to apply a patch it should be possible to update the firmware. In fact, a person could read the firmware from two versions of the radio and see exactly what the differences are. However, since the CPU is presumably accessing the EEPROM on a continuous basis -- including to run the serial data communications protocol -- in practice there would be a danger of modifying a portion of the data control program which is being used during the data transfer protocol. Therefore, experimenting with this would have a risk of corrupting the radio control program, rendering the radio unusable.

Why don't you try first reseting the VFO of KG-UVD1P, to certain extent it works and the problem may get solved and getting into firmware make it a last option

Subject: [Wouxun_KG-UVD1] 1750 Hz tone no longer working on KG-UVD1P

When I first got my KG-UVD1P, the 1750Hz tone worked... I made a bunch of settings changes and unlocked the VFO. Now when I try it, it doesn't work.

It's not a critical feature... but it would come in handy.

Anyone else have this problem?

KG-UVD1P contains EM78P568 MCU. It contains 16k x 13 bits of OTP (One Time Programmable) ROM memory - once programmed, it cannot be reprogrammed.

64kbit (8kbyte) EEPROM contains only settings - not only channel memory, but all radio settings (broadcast radio channels, current frequency, ctcss, memory locks, display mode, step, ani-id etc. - everything you can change from the menu or program into radio). MCU cannot run code from this EEPROM - it just stores all settings there.

It would be nice if firmware upgrade would be possible, but unfortunately it's contained in the mentoined OTP ROM. In order to upgrade firmware one would have to physically solder new MCU.

An inexpensive radio like this cannot be expected to have all the bells and whistles. If you'd like to try hacking, hack away. The worst thing you would do is ruin the least expensive radio, feature for feature, on the market.

3588. Is it possible to update the "chinese sounding" english voice commands ?

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-12-08 07:53:07 UTC
From: skafidasmc

I reading about the possible "home-made" firmware updates...
So the following question popped in my mind...

Would it be possible to update the voice commands to something more "english" sounding than the english spoken by the chinese lady?
Would these be stored in something that can be reprogrammed?

I know this is a lot more complicated than it sounds...just checking for ideas..

/alex

3589. Re: [Wouxun_KG-UVD1] Is it possible to update the "chinese sounding" english voice commands ?

There's a voice module soldered as an extra add-on board with a bonded
chip on it (U812 on the circuit). From the schematics it's pinout can
be determined:

1. VDD - 5V power input
2. Reset - reset input, active low
3. Vout - analog voice output
4. OSC - externally biased to 1/2 VCC
5. GND - ground
6. Busy - busy output (open drain)
7. Data - digital data input (or open drain i/o)
8. CLK - digital clock input

Busy - from the schematics seems that it's an output that goes
low when module is idle and tri-state when device is speaking.
If it goes tri-state then external resistor pulls it up and MCU
enables the speaker.

It's very possible (but unknown for sure) that the bonded chip is
OTPROM or even MROM (it's cheaper than using flash memory), so the
only way to replace the sound would be to replace the entire module.
But it theroretically could be serially reprogrammable, for example
some modules from voiceland.co.kr allow that.

Maybe someone interested in this could investigate this a bit
deeper and for example find the manufacturer of this sound module
or match the transmission protocol to something known (it can be
I2C or something propertiary).

The only non-English sounding command (to my ears)
is "six-uh", and it actually helps me out a little.

Other than that, it's already been stated that all
the firmware is contained in a write-once chip, so
it's not possible to update.

3602. KG-UVD1P battery

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-12-12 16:57:13 UTC
From: Dan
Topic: 3602 Message: 3602

I noticed that Wouxun includes a 1300mAH battery with the KG-UVD1P, but only sells a 1700mAH replacement battery.

I'm not complaining, but I am curious as why they don't sell the 1300 mAH battery as the replacement battery?

It seems to me that making a large number of one battery would make for greater economies of scale rather than making two different batteries in smaller amounts.

They probably make enough of each to warrant two different batteries (they probably use the same battery across several models too)

To be honest, if I'd known how long the radio lasted on one charge I probably wouldn't have worried about a 1700mA for the spare - I might not have even bought a spare as the charger works from mains or a car 12v socket!

At some of the HK suppliers you can get a 1300, 1400 or 1700mah replacement battery for the KG-UVD1($15.50-$19.00).

Hi all.

I am new to the list and I hope to be able to contribute as well. I just bought a new 144/440 Wouxun hand held and I am impressed with its features.

It is the latest model (so I was told) KG-UV2D and it covers 136-174 and 350-471 MHz on RX. The TX however is Ham band only 144-148 and 420-450MHz.

Has anyone found if the known procedures (entering codes or software) works on this model or is it too new yet? I would imagine that there is a MARS/CAP mod available somewhere. BTW Does anyone knows what TDR on the Green button actually means, I know what it does?

Hello Tony,

I just bought one last week. The unit had to be flashed with special
Wouxon software to get the additional coverage. I think my UHF now goes
to 502MHz.

I'd like to know what TDR stands for too. The manual is the typical
Asian interpretation of English, hard to read.

TDR switches from dual band to single band. A/B will determine what band in mono band mode.

I think what he meant was "what is TDR an abbreviation for?".
TDR in most amateur circles stands for Time Domain Reflectometer.
I'm sure that's not what was intended by Wouxun.

Inquiring minds are curious- I'd like to know too!

Bob,

I don't know the other models so I can't tell if it has any additional features. However the "Touch-Tone" function works fine and will be send as long as you hold the digit down while transmitting. It does toggle the reverse frequency on the display when pressing the "scan" button as (I think) some earlier models did not do. It seems to do all that the functions that are mentioned in the manual.

The ANI still only works on transmit and does not decode on RX. As it is, it is rather useless unless one has an application on another receiver that makes use of it.

Tony.

It's not dual/single band, but dual/single VFO. Both VFOs can use both
bands (VHF and UHF) and A/B switches between VFOs.

KG-UVD1 (no DTMF, discontinued?)
KG-UVD1P (now with DTMF. "Basis" for all below.)
KG-UV2D (Europe, limited availability in the USA -> wouxun.us, www.marktwainradio.com, + few more)
KG-UV3D (USA -> Powerwerx)
Albrecht DB270 (Europe)
Alan ..?.. (UK?)
MAAS AHT-2-UV (Europe)
MIDLAND CT-790 (UK?)

Internally appear to be mostly the same (except some firmware upgrades over time). Searches under these other names can produce interesting/entertaining results (Youtube etc).

3621. Hams and FCC part 90

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-12-16 19:39:34 UTC
From: Kent Hufford
Topic: 3607 Message: 3621

The KG-UVD1P complies with US FCC Part 90 as a "business" radio.

If you are a HAM with a HAM group supporting an event that the event operator is using commercial UHF HT's within range of the KG-UVD1P UHF band for his command and control. The event organizer/operator asks you to operate (Tx/Rx) your KG-UVD1P on his UHF freq to relay information that you have gathered.

Is this "legal"? If you do not use your HAM callsign.

thanks,

Kent

It would be legal, as you have a type-accepted business radio.

You would be operating under the authority given by the licensee of the frequencies you are using. It is the same deal if you use your Wouxun at work (if you use radios there) You would operate under the license of your company, not amateur radio.

As far as i understood its not a "new" firmware, its rather a customized firmware. I bought a UVD2 here in Germany and it still does have the issue with not showing the memory name anymore when switching between channel and frequency mode and back to channel mode. According to QST that should have been resolved....

How is the PMR (business radio) license structured? Does one license cover a number (infinite?) of radios for one organisation?

Do we require type-approval for PMR?

I would guess that nobody would "come looking" as long as we weren't running a large fleet of users with a license for just 5 and, as the Wouxon is FCC-approved, it should be "clean" enough that it would not attract any attention on the air.

As far as I know in the UK providing you are on a PMR freq. and not on the Amateur bands then this would be legal.

Yes, spot on.

I hold an Amateur Licence, plus 2 PMR licences (Business Simple and Technically assigned). If anything, the UK is less strict than the US as there is no type approval requirement for PMR/PBR radios anymore.

Not legally on FRS, as it's a watt instead of just half, but it will go to those. I have them all programmed into mine.

They can't legally be used for FRS (having a detachable antenna makes them rule-breakers), but with a license, I think you'd be OK using them for GMRS (assuming you're licensed to use GMRS). I heard through the grapevine that the FCC is going to de-license GMRS, but it might take them awhile because they would either have to wait for everyone's license to expire or give a lot of license fee refunds to people who have paid them for licensed use of those frequencies.

And the LONG answer is a qualified YES.
You may use GMRS frequencies but not FRS.
The radios put out too much power for FRS limitations but GMRS is okay to 50 watts so have a ball - - - as long as you have a GMRS license! Ham license doesn't cover GMRS and vice versa.

Hey guys, if you don't know, please don't quote or repeat that which you don't know. GMRS is NOT in joepardy of going away and the FCC is just waiting for the licenses to expire. That's rediculous.
There IS an NPRM active right now that you may respond to if you wish to comment on the FCC's PROPOSAL to make some changes which may affect GMRS Part 95 rules. It is a streamlining of the Part 95 and they are doing many areas of the Rule Book.

One problem is that much of the equipment is wideband and GMRS is presently excluded from the wideband transition for Part 90 coming up. That's why everyone in public safety and commercial arenas are scrambling to get new narrowband equipment.

Incidentally, the FCC doesn't give refunds either.

FRS is just that; FRS. It has very specific limitations such as non-removable antenna, power restrictions, frequencies, etc. Even the popular 22-channel FRS radios require a GMRS license on most of the channels but the manufacturers are shy about reporting that unless it is in 4 pt font on the inside of the back page in Chinese. They also exaggerate the range capabilities tremendously. Their power limitations simply will not transmit 38 miles as one I own states. The rule of thumb for simplex is 1 watt = 1 mile of unobstructed range. Just how far do you think a 1/2-watt radio will talk? Yep, probably down the street several blocks and perhaps a mile if you are lucky in a typical housing neighborhood. This is why the beauty of GMRS is beneficial because it allows 50 watts but YOU MUST BE LICENSED and to do that you only need to be able to write a check for $85 to the FCC for a 5 year license.

They can't legally be used for FRS (having a detachable
antenna makes them rule-breakers), but with a license,
I think you'd be OK using them for GMRS (assuming
you're licensed to use GMRS). I heard through the
grapevine that the FCC is going to de-license GMRS,
but it might take them awhile because they would either
have to wait for everyone's license to expire or give a
lot of license fee refunds to people who have paid them
for licensed use of those frequencies.

Ed, why did you agree with what I said, then say it's ridiculous?

Waiting for the licenses to expire means the same thing as de-licensing.
I posted a screen capture from the article in the "group files" section if
you want to read it. The news was broken in Monitoring Times magazine,
Nov. 2010 issue, page 6. If the moderator is concerned about copyright
issues, then please feel free to delete the snippet I posted.

To quote the article, written by Ken Reitz: "Now the FCC wants to drop
the license requirements, fees, and call signs issued". If that isn't
de-licensing,
I don't know what is!

They are also asking GMRS makers to narrowband the radios they make
from 25KHz to 12.5KHz. Know what happens when they do that? They'll
issue a rule which will make 25KHz wide radios ILLEGAL. Of course, the
rule will probably have no teeth, just like when they made 23 channel
CB radios illegal. (Yes, they are...) Nobody cares, they're still used all
the time, and the law is not enforced.

As a GMRS license holder, yes, I'm concerned about my investment in the
license, and unlicensed intruders interloping on GMRS frequencies. I've
successfully filed complaints with the FCC to have local unlicensed and
commercial users thrown off of GMRS frequencies because of interference
with our local repeaters. Nobody has been fined, everyone has been
cooperative.

Of course the radios I have will get used far into the future, 25KHz
wide or
otherwise.

I'd say that if the FCC terminated all the GMRS licenses at once
and didn't give any of the license holders a refund (and I have no
idea how many of us there are), that they might be in for a class
action lawsuit. Part of licensing means that you're entitled to use
the band with other licensed users, and for the fee, you are
protected from unlicensed users for a period of 5 years. Since
I just renewed my license this year, I'd say that the FCC owes
me (as well as all other licensed users) another 4+ years of protected
use of the band. It's called "fee-for-hire", basic law, though the
FCC may believe they're above the law.

Of course they are (above the law). They took part of the 220 band away from hams some years back and they took part of the 440 band away in No Calif to give to the military. They do whatever they darn well want to do even over objections by the ARRL, REACT, commercials, and public safety pleas.

Yes, they did (take away parts of the 220 band and geographically
restrict parts of the 440 band) , but no fee-for-hire implied contract
exists with amateur radio licensees. When we renew our licenses
(unless we have a vanity callsign) we aren't paying for the exclusive
use of the frequencies. GMRS license holders ARE (paying for the
use of certain frequencies).

Remember, hams are SECONDARY users in the 440 band, which
means our wants and desires don't matter. We're allowed access
only by the grace of whoever is in charge of the FCC at the moment.
If we were primary users, it would be a tad more difficult to take
our frequencies away and give them to someone else. Only a tad.
But when money exchanges hands, it becomes a different ballgame.
Then you have to examine contract law.

It would make sense that they'll wait and let all current licenses
expire, and not issue any new ones. That way they would not
be violating any implied fee-for-hire laws. It's illegal for them
to charge you for the use of something, then take it away without
remuneration. But if they simply refused to sell you a license when
the one you have expires, they would be completely justified,
and in fact, if they wanted to, could re-farm the frequencies to
another use!

My reference to it's rediculous was aimed at the statement of expecting a refund from the FCC. That simply is not going to happen.
Ever send fees to them without a form 159? Try it; you'll love it - getting your money back that is.
Without the Form 159 to accompany the funds, they simply send the funds into the general fund to comingle with the rest of the money never to be found again. The 159 is required so they can place the funds into the proper accounting hole; without it, the money doesn't know where to go except into their big pocket - the general fund. I wasn't really agreeing with you and then disagreeing with you.

What the FCC "WANTS" to do is totally different that what it will ultimately do. Have you read the responses to the NPRM? You apparently are a licensed GMRS user. Did you file a response? Why not? Yes, you will find mine there - one of the first ones on page 1 I think.

Rules were not made to be broken. They are made to be respected and followed. This is why we have traffic collisions - someone has broken a rule. If people break FCC rules, there will be a collision on the frequency. To say you will have use of your 25KHz equipment for a very long time means you will have a collision eventually. You say you have been on the complaining side of the table; you will eventually be on the responding side of the table if that comes to play. I hope not. All this equipment will have future use for a very long time - as boat anchors! Look at eBay. People are dumping fm equipment right and left to the unsuspecting victim without conscious. That is a violation of our ham integrity.

I am aware of 23-channel CB radios being illegal to sell, trade, or give away. You may still use one if you already owned it at the time the rules changes. I still have one or two - one is actually tube (valve) type. Whether the FCC decided to jump all over a person for selling one is discretionary. They will normally go after the dealer or manufacturer and not the user. The same is true with FRS. Normally they will not seek revenge upon an FRS user for being on the wrong channel unless he/she is interferring with a repeater or other user for which the person is not licensed for.

Ed Greany
Ham, KB6DOL
GMRS KAD6554
and yes,
CB KQA7422 (I have one of those also and I DO use it when on 11-meters).

The only way I foresee that they would do this is to do a grandfather-type scaling down. They would have to simply STOP issueing licenses on day one and allow licenses issued the previous day to continue for the remainder of their 5 years. Meanwhile, that last year would be pretty fruitless as communications goes. They're just not going to give back money.

it's easy to set it up with the international VHF marine frequencies i have files with UHF CB and VHF marine and anything else i could squeeze in for my local area. we use them a bit on marine and they work great.

I guess the FCC might have the same rules as the australian government which is it's illegal to use equipment your not licenced for but in the case of an emergency you may use any means possible to get help.

No. Frs and gmrs are part 95.. Rules for both require proper type acceptance. Some commercial gear has part 95 acceptance for gmrs but not frs.

The taking away of amateur radio spectrum in the 420-450 range has not ever occurred. Restrictions on the use of the spectrum which is only a secondary user of the range of frequencies are in place in only 2 locations in the USA. This is neither here nor there.

The FCC is debating whether or not to eliminate the GMRS licenses and turn the frequency range over to another service. Let's not talk of de-licensing or any other new world language. If the FCC wants to shut down the spectrum it is their prerogative to do so, they are the regulating agency. Most of us were not around during World War II, that period is an example where the regulating agency restricted access to the radio spectrum.

Can we keep this civil and think out what we are saying before flying off on any tangent which leads to further misinformation? It makes no sense arguing over something like this when all the facts are available and some are not presenting the facts.

I hear a lot about "GMRS", but what is this used for? In UK/Europe we have "PMR446", which is 0.5w similar to FRS but on slightly different frequencies, but I don't understand what GMRS is, with 50 watts power limit - what's it used by/for?

Interestingly, USA seems to have always been ahead of us with "public" radio licensing. You guys had CB a long time before it was legal here, and our (legal) CB is 5 watts into a negative-gain antenna and FM only. You had FRS a decade or more before UK (PMR446). Our 2m band is just 144-146, 70 cm is 430-440 (all secondary), while you have a wider allocation on 80m. How is it that "authority" needs more bandwidth in Europe than in N. America? (!)

Subject: [Wouxun_KG-UVD1] Re: Can you use the FRS / GMRS Frequencies

The taking away of amateur radio spectrum in the 420-450 range has not ever occurred. Restrictions on the use of the spectrum which is only a secondary user of the range of frequencies are in place in only 2 locations in the USA. This is neither here nor there.

The FCC is debating whether or not to eliminate the GMRS licenses and turn the frequency range over to another service. Let's not talk of de-licensing or any other new world language. If the FCC wants to shut down the spectrum it is their prerogative to do so, they are the regulating agency. Most of us were not around during World War II, that period is an example where the regulating agency restricted access to the radio spectrum.

Can we keep this civil and think out what we are saying before flying off on any tangent which leads to further misinformation? It makes no sense arguing over something like this when all the facts are available and some are not presenting the facts.

No, no, NO! They're not even considering refarming the GMRS frequencies, they're merely debating whether or not to turn the service into a no-license free-for-all like they did CB. The band has gotten out of control with manufacturers selling those little HT's by the millions that have GMRS capability built right in. And people buy these things and think it's OK to use those frequencies without a license. This has created a "hardship" (boo-hoo) on the FCC who can't possibly enforce their own laws, so they think it's better/easier to flush their laws down the toilet rather than to enforce them.

There are a couple of areas of the U.S. that the government instituted the use of Pave Paws radar systems. This made amateur use of certain parts of the 440 band incompatible with the primary use of the band, which is government use. (We're considered SECONDARY users of 440.) So it was easier for them to shoo us away than to expect us to voluntarily shut down our repeaters that were causing interference to their radar system. If this isn't the "taking away of amateur frequencies", then I don't know what is. If you could use it one day, then the next day it was illegal, isn't that taking the frequency away? If it's not, please explain your rationale. Of course if you don't live in those areas, it won't affect you.

Sorry if you think I'm flying off the handle and/or being uncivil. I'm not. There's no way to place voice inflection onto typed text. This is merely a discussion.

Thanks, -Web

Hi Stu,

GMRS (currently) is a licensed UHF CB radio service. The primary differences
are that we can set up a repeater on the band, and are permitted to use up to
50 watt radios. You're not allowed to use it for business purposes. And you have
to pay $85 for a five-year license.

FRS users are not allowed to set up repeaters, and are limited to a 1/2 a watt.
The radios are not allowed to have removable antennas (to prevent them from
being connected to an outdoor antenna, amplifier, or something high up in the
air). There are FRS "base stations" (Unwired UFR-BS10), and I think Radio
Shack used to make an FRS mobile set, which was somewhat useless because
it had a built-in antenna (as required by law). The set was usually mounted
under-dash, and that placement put the antenna where it was surrounded by
the metal car body.

Another use for these little radios is the little-known MURS service. It's an
unlicensed VHF service on 15X MHz frequencies. It's license free, and gives
one a little more leeway with respect to antennas and power levels. The
channels for MURS are usually referred to as (color) dot or star. (i.e. red-dot,
blue-dot, yellow-star, etc.)

I think that the European CB band being on FM, in my opinion, was a sort of
collusion between the FCC and your authorities to prevent inter-continental
contacts between the U.S. and Europe. I think it goes back to the old telephone
rules. At one time, ham operators were forbidden to make phone patches for
folks between the U.S. and England because the perception was that it would
cheat the government-operated phone company out of it's just dues. It may
still be illegal, I don't know.

Can anyone confirm that the Powerwerx KG-UV3D software will work with other Wouxun models such as the KG-UVD1P?

The Powerwerx version appears to add the ability to place your call sign as a welcome screen when powering up the radio. But it could also corrupt the radio and make it nonfunctional.

Has anyone tried this?

I don't know what GMRS is used for in USA, but I can see a problem there for "Mum and Dad and the Kids", who use FRS (FAMILY Radio Service!) to keep in touch in the supermarket (same as my own XYL and I did with the UK's PMR446, until she got a license to operate 2m) when GMRS users start spreading onto the FRS frequencies and their 50 watts flattens anyone using half a watt into a "-3dB stubby".

Maybe the FRS frequencies will still be limited to 0.5 watts, but will the guys with 50w stay off them if the FCC doesn't/can't police it?

The FRS and GMRS frequencies aren't identical. They're just a tad off.
Usually,
if you have a GMRS repeater that is PL tone protected, the problem is
people
with the little FRS/GMRS handhelds will get -slightly- off frequency,
but have
the proper PL tone to set off your repeater, and the repeater goes on
the air
with hash and noise, no intelligible signal. And yes, I can see an FRS
radio
being "flattened" by a 50 watt signal. But the laws don't protect FRS
users.
I think they operate under rules that they are not permitted to cause
interference,
but at the same time, must tolerate interference from other sources.

I tried it with a KG-UV2D.
The box where you enter the welcome screen message shows some gibberish ASCII characters.
I could not change the welcome screen, probably because the firmware in the radio is not capable of it, but otherwise the software appears to work OK and it does allow you to put spaces in the channel names.

FRS is narrow band and the GMRS wide bandwidth will allow both to be able to communicate. I see.

Thanks for the correction :)

Attachments: 1 described; binary payloads are missing from this source WARC

HI from New Zealand,

We have similar rules to the US. We have 26Mhz CB though and that was to stop 'free calls' between Australia and us in the bad old days (it didn't tho)
We also have 477Mhz UHF CB (PRS) which we share with Aus and we can have repeaters on this but we are limited to 5w but we can use radios with detachable antennae and things. Most 4x4 owners have them either in car or at least one portable. Some use it for business and lots of farms have their own repeater. Unlike Aus, a repeater here is 'open' meaning it can't be locked out by CTCSS etc.
We are now looking at opening up the 27Mhz CB band to match Aus and the USA as it will be cheaper to supply equip,ent and there are more options.

Have to say, Eurpoe and the UK is pretty 'closed' for public radio. It will stem back to the old days in Europe where there were socialist Govt.s that didn't like people using non official communications etc and the UK for the old 'getting around the phone' thing. The Euro 27Mhz on FM is just pathetic. Why not make it all the same!

Oliver

Last year, the "in" thing was Brazilian satellite hackers using
220MHz amateur gear to hack into the U.S. Navy's unscrambled
satellite system to communicate between the U.S. and "back home".
It was (and probably still is) a big problem. I found it was easy to
listen to them with a simple vertical antenna and my Alinco DR-235,
though I can't remember what frequency it was I was listening to
at the moment. And it was in Spanish, and I no speekee Spaaneesh,
so it wasn't the most exciting thing to listen to.

Oliver wrote:

HI from New Zealand,

We have similar rules to the US. We have 26Mhz CB though and that was to stop 'free calls' between Australia and us in the bad old days (it didn't tho)

We also have 477Mhz UHF CB (PRS) which we share with Aus and we can have repeaters on this but we are limited to 5w but we can use radios with detachable antennae and things. Most 4x4 owners have them either in car or at least one portable. Some use it for business and lots of farms have their own repeater. Unlike Aus, a repeater here is 'open' meaning it can't be locked out by CTCSS etc.

We are now looking at opening up the 27Mhz CB band to match Aus and the USA as it will be cheaper to supply equip,ent and there are more options.

Have to say, Eurpoe and the UK is pretty 'closed' for public radio. It will stem back to the old days in Europe where there were socialist Govt.s that didn't like people using non official communications etc and the UK for the old 'getting around the phone' thing. The Euro 27Mhz on FM is just pathetic. Why not make it all the same!

No one can tell... true.. BUT... if you don't have a GMRS license...
people will tell... been there, done that. I gave up GMRS when the fight
against "pirates" became a losing battle.

As far as hardware.... many people do it.. Even hams, who care nothing
or are ignorant of the rules that require the Part 95 approval (which
our Wouxuns have via the FCC ID for Part 90 type-acceptance)

I found some of the frequencies they use on RadioReference.com posted in 2007.
The FCC cracked down on them, arresting some in New York City and I think Boston, so traffic may not be there, but it was in the past. -Web

EDITED RANDOM REPOSTS FROM RADIOREFERENCE.COM WEBSITE:

For the last couple of hours, 258.650 (NFM) has been almost continuously active (foreign language mixed with some English).
Hearing it fine with a BCD396T, Scantenna and 20db preamp. Not my usual setup for listening to satellites.

You'll need a decent antenna to hear anything at all.
Tonight the most active frequency was 255.550 mhz (NFM). They were on for a few hours with a strong signal.
Even with a good setup, you will hear a lot that 'sounds' like static.
There are a lot of digital signals that show up on those frequencies and much of it sounds like open squelch noise.

I've heard pirates (Spanish) on 263.825 FM early in the morning around 8:30 AM EST. Using a PRO-43 with a 220 Mhz Ham Band rubber duck antenna.
These antennas only cost around $15.00.

255.550 is active now. 9:06 pm EDT
255.550 and 265.450 sounds like SSB.
Also, 269.950 is often active.

Hi Stu,

GMRS (currently) is a licensed UHF CB radio service. The primary
differences
are that we can set up a repeater on the band, and are permitted to use
up to
50 watt radios. You're not allowed to use it for business purposes. And
you have
to pay $85 for a five-year license.

FRS users are not allowed to set up repeaters, and are limited to a 1/2
a watt.
The radios are not allowed to have removable antennas (to prevent them from
being connected to an outdoor antenna, amplifier, or something high up

in the
air). There are FRS "base stations" (Unwired UFR-BS10), and I think Radio Shack used to make an FRS mobile set, which was somewhat useless because it had a built-in antenna (as required by law). The set was usually mounted under-dash, and that placement put the antenna where it was surrounded by the metal car body.

Another use for these little radios is the little-known MURS service. It's an
unlicensed VHF service on 15X MHz frequencies. It's license free, and gives one a little more leeway with respect to antennas and power levels. The channels for MURS are usually referred to as (color) dot or star. (i.e. red-dot,
blue-dot, yellow-star, etc.)

I think that the European CB band being on FM, in my opinion, was a sort of collusion between the FCC and your authorities to prevent inter-continental contacts between the U.S. and Europe. I think it goes back to the old telephone
rules. At one time, ham operators were forbidden to make phone patches for folks between the U.S. and England because the perception was that it would cheat the government-operated phone company out of it's just dues. It may still be illegal, I don't know.

Topic: 3629 Message: 3673

That's an odd opinion- we have CTCSS on our amateur radio repeaters
not for the purpose of keeping out unwanted users, but to keep out hash,
noise, and interference from wearing out a repeater prematurely. In fact,
the frequency of the CTCSS used is broadcast during identification as an
aid to help people set up their radios to use our local repeaters.
They're all
open to the (licensed) public.

There are areas in the U.S. where it is common for repeaters to be "closed"
and only for the use of certain individuals, and this is totally legal.

GMRS is similar. You may choose who may and who may not use your
GMRS repeater. You may also provide written permission to others to
use your GMRS license (normally for family members). In fact, legally,
you're supposed to have written permission to use a GMRS repeater that
doesn't belong to you. At least that was the way the law read when I was
licensed about 6 years ago.

We have several radios regular and P version that it works fine on.

1- To insert a space in the display, enter a hyphen. If you read the radio with other versions all infor after the space will not display

2- The Custom announcement will not work on older radios, it is a firmware situation in the 3 version.

3- We have experienced NO PROBLEMS with locking or any other issue on the older radios

I have finally got around to programming a few more frequencies in my 2M-220 (14 channels) and 2M-440 (24 channels) Wouxum KG-UVD1P's. I noticed now when I have to twist the rotary encoder thru more than a few channels, the encoder knob definitely gets tougher to turn once I get past CH 8 to 10. And then gets easier once I complete the full frequency change and go back to the start. Also, the CH location where the "stiffness" occurs seems to be changing. Both radios exhibit similar conditions.

Anyone see this?

Roger,

That is easy to fix. Pull the knob straight off. On the bottom of the knob you will see some plastic left over from the molding process. Use a sharp knife to remove the chaff and reinstall the knob. All will be well.

I think its a combination of the chaff on the knob and the control not being 100% straight. We had a large batch with the issue and every one had that plastic on the knob. A minor quality control issue but otherwise an OK unit.

Jim,

Thank you for the tip. I used medium grit sand paper, followed by fine paper to smooth the bottom of the knob. 'Difficult' task, it took just over one minute.

I didn't think of that! However if I was transmitting on 146.520 I'd be getting a call from The Authorities!! (UK only has 144 to 146.000)

In UK we use 12.5 MHz steps so there's not enough space for all the digits. I find that the programming sheet will allow various non-alphanumeric characters, but NOT a decimal point. If I put in a "-", then it displays as a space, so I have my simplex channels labelled "5 500, 5 5125, 5 5250" etc (5-500 and 5-5125 on the programming sheet) and then 3 250 etc for UHF.

I manage to get enough in 6 characters to identify the towns of the repeaters (rather than call-signs, as my XYL doesn't know all the repeater calls, and I am familiar with a only some). I've not messed with anything else, but there does not seem to be a problem with using the Powerwerx UVD3 software so far.

Ah - While I'm working, the XYL is on Denbigh repeater!!

Hello,

Today I noticed an interesting behavior of the battery charging process.
The radio is the KG-UV2D
The battery is approximately one month old and was partially discharged when I placed it in the charger. After placing the radio into the stand, the red charge light was steady on indicating charging. After several hours, the green light came on but did not stay ON. The green light remained ON for several seconds, switched back to red for several seconds and back to green again. This continues for over an hour and the green light did not remain continuously ON. It appears that the charger terminates the charge, the green light comes ON and after several seconds reverts back to the charge mode. The radio is OFF while charging.
Has anyone observed the same phenomena?

Thank you.

Mort, NA6MA

Subject: [Wouxun_KG-UVD1] Charging the starndard battery

Hello,

Today I noticed an interesting behavior of the battery charging process.
The radio is the KG-UV2D
The battery is approximately one month old and was partially discharged when I placed it in the charger. After placing the radio into the stand, the red charge light was steady on indicating charging. After several hours, the green light came on but did not stay ON. The green light remained ON for several seconds, switched back to red for several seconds and back to green again. This continues for over an hour and the green light did not remain continuously ON. It appears that the charger terminates the charge, the green light comes ON and after several seconds reverts back to the charge mode. The radio is OFF while charging.
Has anyone observed the same phenomena?

Thank you.

It is OK to get the blank space displaying on the channel name while editing manually through the keypad.

Hello Jay, i would like you to tell me if you are able to unlock the frequencies of your wouxun's J10 firmware.
I want to buy 2 of those sweet radios but i want to make sure that i can unlock them so they RXand TX at those "locked" frequencies.

Gentlemen:

The Jxx in the serial number has nothing to do with firmware. It is the month of manufacture. Firmware changes could be made in the middle of a month and the J number would remain the same.

All dual band versions are the same radio inside so all can be set for various frequency limits. I personally import mine factory-set to TX in the ham bands only because I think it is the responsible thing to do. With unlocking software, all radios can be set for any limits within their designed frequency range. (you can't change a 350-470 radio into a 420-520 version)

When I started selling the 2D model in the US,(it was a Euro release first) I requested the menu 21 firmware improvement. This was supposed to remain a selling point for this model only, but Wouxun-China has now includes this improvement in all models. (not sure about those sold out of Hong Kong)

The 2D's copper bezel has been replaced with the all black case. Future 2D models will also include the programmable welcome screen.

Merry Christmas,
Ed Griffin

Here in EU i can find wouxuns UVD1P with j10 and J12 firmware and MAAS("clone" of UVD1P) with J06.
I want to buy 2 of these sweet radios and be able to unlock their limits so i can get 121 mhz and open a little more the 400-470 mhz range if its prossible.Can u suggest what to buy?

Wouxun's dual band radios only operate 136-174 MHz on VHF.
The UHF ranges vary. 350-470 & 420-520 are more popular, but there are 400-480, 400-470 and 430-440 versions also.

Ed, is there a way to ajust the low power level?
Mine puts out about 2.2 watts on both bands.
Ideally I would set it 10 dB less than high power (.4 - .55 W)

From one of the Ed's on this list; it's either High or Low as far as I know. I will mention that while transmitting, pressing the TDR button will temporally change your power level. Some out there may not know this.

I know how to switch between high and low power. That is not the
problem. Let me explain this better.

My KG-UV2D puts out over 2W when set to low power (high power is 5.5W on
VHF and 4.5W on UHF which is acceptable).
The specifications says low power should be 1W. I want to know if it is
possible to calibrate the low power setting.

On other radios I have owned there are alignment procedure that allow
you to do this.

Tom

Chris, my firmware is J09, not J10, and yes, it unlocks just fine using some software I found on line. I don't remember where it came from, possibly the Yahoo files site. I then relocked the range to minimize possible out-of-band problems, as it's a case of "when" not "if" one makes a mistake and puts out 5 watts where it's a no-no.

I have no idea whether later firmware versions can be unlocked. I just noticed a response from Ed Griffin at WouxunUS where he said the Jxx is a reference to date, not firmware version. FYI.

Stu,

Mine only shows the ham band range of TX frequencies (i.e., 144.000-147.995, and 420.000-449.995, US model). Does yours show more information than that?

Ed,

Is there any way one can tell what version a particular radio is, i.e. 350-470 or 420-520 aside from trying to use the expansion program and experiment with the settings? Do you know if the Wouxon is certified by the Canadian Government? Thanks in advance for your reply.

Wouxun's dual band radios only operate 136-174 MHz on VHF.
The UHF ranges vary. 350-470 & 420-520 are more popular, but there are 400-480, 400-470 and 430-440 versions also.

Yes they are certified but I don't recall the certification number. Wouxun was kind enough to have this done after I had a rather large order going there.

3708. Re: [Wouxun KG-UVD1] UV2D or UVD1P

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-12-20 19:08:00 UTC
From: wouxunus
Topic: 2781 Message: 3708

Those bought from me at Dayton last year were all 350-470 versions.

Wouxun has caused confusion with the labels on my radios because I choose to have them factory-set to transmit only in the ham bands, so this is how they are labeled. Many customers look at the label on the box and immediately call saying they have the wrong radio. It has been almost impossible to explain this to some of the ;-)

In a recent discussion, I have convinced them to put both the TX and RX range on the label. Hopefully this will fix that problem.

It's simple to tell which model you have if you have not unlocked the frequency range. Go to Frequency Mode and keypad in 490 MHz. If the radio accepts it, you have a 420-520 version, if it doesn't, you have a 350-470 version.

Mine shows 136 -174.995 and 400 - 470.995

Possibly US ham dealers "lock" them to the US allocations (do you REALLY have a 70cm band that is 30MHz wide?!)

Mine came from China before there were any dealers in UK.

I just noticed that mine has "International Ver" etched into the aluminium chassis just below the sticker (I guess the chassis is made of Aluminum in USA!!)

Stu,

Mine only shows the ham band range of TX frequencies (i.e.,
144.000-147.995, and 420.000-449.995, US model). Does yours show more
information than that?

Tom, Ed,

From what I can gather from the service manual info and the schematic is that the microprocessor, via pin 24, sends a voltage to the comparator which senses the current being drawn by the PA. The current is sensed by measuring the voltage drop across a number of 0.39 Ohm resistors (R615-616-659 and 660) which are in parallel. Notice that the supply voltage for the drain of the driver and PA FET (for both VHF and UHF) is supplied THROUGH the four parallel 0.39 Ohm resistors. Any change in driver and PA current will change the voltage across these resistors and will upset the balance of the comparator which then in turn adjusts the voltage to the driver and PA gates to bring it back into balance.

This, sensed, voltage goes to the comparator IC (U612A and B) which compares it with the voltage supplied by the micro processor. This IC in turn adjusts the voltage (which is the gate bias) on the driver and power amplifier FET. I can't find any controls to preset the voltage coming from the micro processor to adjust the level for the automatic power control. I suspect that they are fixed in the firmware and it will output this voltage level depending on the H-L power command from the keyboard etc.

If the measured power output is not correct I suspect that there is something wrong with the radio and it may be due for warranty replacement. The service manual does not provide a sufficient amount of useful information to do real servicing of this radio. In all honesty, I had a look at the inside of the radio and the size of the SMT components would deter any service tech from trying to do any repairs to it without very special tools and a very good microscope. It is probably cheaper (if it's out of warranty) to cut your loss and replace it. But.. that's my opinion and yours may very. Maybe Wouxun is a generous company and will take care of you.

Yeah I downloaded the service manual and saw all that.
I would think the factory has a procedure to set the voltage that the processor puts out on pin 24 so they can calibrate the output power levels during production, but maybe not. That might be a waste of time and money to them.

Tom,

Great that you where in that job. Off course I was referring to the average ham who has no, or little, experience in this. I would have reservations of doing it even though I have been in two way radio technical service for about 36 years. I don't have the equipment to deal with these small components. It'd be nice to get some detailed information on the Wouxun though. Good luck.

If anyone is 'brave' and willing to experiment, one option to vary the power is to adjust/change resistors R614, 656 or 657. This will change the voltage at the +input of the power control comparator. As a result the current through the 0.39 Ohm resistors will have to be different in order to balance the +input voltage.
Is it worth it? I do not think so.
I have added a pictures of that portion of the circuit in the Photos section.

> If the measured power output is not correct I suspect that there is something wrong with the radio and it may be due for warranty replacement. The service manual does not provide a sufficient amount of useful information to do real servicing of this radio. In all honesty, I had a look at the inside of the radio and the size of the SMT components would deter any service tech from trying to do any repairs to it without very special tools and a very good microscope. It is probably cheaper (if it's out of warranty) to cut your loss and replace it. But.. that's my opinion and yours may very. Maybe Wouxun is a generous company and will take care of you.

Hi Tony,

Yes, the radio is certificated with IC approval.

G'Day Web,

It should probably be clarified that the band Dave is writing about is a citizen band in Australia and that UHF CBRS radios are operated theoretically under a class licence.

I say theoretically because in general the specific purpose of channels are often ignored and the language used, particular in the larger cities, often leaves a lot to be desired. Its often not something you should let your kids listen too. Whilst I have heard of ACMA and the Federal police nabbing some of the more troublesome users, its a rarity.

The often privately-funded repeaters are operated under an apparatus license on an assigned frequency. As Dave said, they must be open to the public.

http://www.acma.gov.au/WEB/STANDARD/pc=PC_1688

The reason that the topic comes up occasionally for 'amateur' radios such as the UVD1 is because, seemingly like all electronics in Autralia, UHF CB radios have an overly-healthy margin on them. For better or worse enterprising individuals save a bundle by using programmable 'amateur' radios. One of the problems we have now is that ACMA is proposing to introduce a further 36 channels interleaved between the current 40. The spec is just that, a proposal, but a number of people have already had programmable amateur and commercial sets adjusted for the proposed channelisation. I've even seen retailers offer this as a service despite the new plan not being final, which is irresponsible IMHO.

Regards,

Lee

Is there any more news on when the mobile will be available and any better ideas on pricing? Does anyone know if they have been sent for FCC testing yet? The only thing I would really like to see changed on it, is to add 2.5 step sizes for the new splinter frequencies, this goes for the handheld as well.

I'm not sure which HT you are referring to, but the CURRENT models will only allow "splinter" channels if the frequencies are divisible by one of the step-sizes - 5k, 6.5k, etc. (NOT 2.5 kHz)

My 144/222 version came through with the copper bezel. It makes it easier to figure out which band someone is calling me on.

And thanks to Ed for marketing these radios in the USA. I am having fun working with all 3 of mine.

Sorry Aussie CBers are scumbags, like in the USA

>

>
Sorry repeater owners have to tolerate the scumbags. If I were a
repeater owner I'd monitor more for illegal behavior and shut down the
system if need be....

CTCSS is used on the USA GMRS (the closest repeater-capable band to uhf
cb) to lock out undesirables... DCS (Digital Coded Squelch) is becoming
more popular too.

It is unfortunate good radio services degrade because 1: the users do
not behave and 2: the regulatory agencies refuse to enforce regulations
and 3: manufacturers produce radios that allow illegal operation
(prevalent in the USA CB band with these so-called "10 meter amateur
radios" that no self-respecting amateur would ever use).

I'm sure you could paint the copper bezel with some crinkle paint formulated for plastics (see your local home improvement store). Similar, perhaps, to the picture now shown on wouxun.us advertising an all-black KG-UV2D (http://www.wouxun.us/images/KG_UV2Dht.jpg).

Regarding the upcoming mobile unit, it'd better be darn price-competitive (US$150-175?). The Yaesu FT-1900R single bander goes for $125 these days... I never use my Icom dual-bander on the 70cm side... just not much happenin' there in spite of the plenty repeaters out there (same reason why I got the cheaper KG-816 hand held). The x-band repeat would be nice to play with, though (I'd value that feature $50)!

Hi Joe,

Thanks much. Anyone who has some spare time, would appreciate a hand with expanding on the menu listing. Most of them are missing info past the top menu choice. That's pretty well the only thing that in my mind is keeping the document from being complete.

From: Roger
Topic: 3737 Message: 3737

It took me a while to figure this out, but if you just attempt to drop the radio into the cup, the battery contact springs kick the radio forward enough so that the tracks don't align with the ridges.

I always seem to be trying this in the dark.

You need to push the radio into the springs to compress them while dropping the radio in and it will work like a charm

Hi Buddy,

Very nice document for a good cause. Maybe someone with knowledge of an organization who translates text into Braille for the visual impaired can have it converted. It's pretty tough for the visual impaired to remember all this. If they can read it in Braille them self, eventually it may stick.

For all I know there may be computer programs who can do this and a special printer can print this.

Tony, VE3DWI / K8DWI.

Hi Tony,

Wait. Most of the blind people I know (including me) have pretty good memories. Of course, things like the PL chart, menu listings, and DCS list would be useful in braille, but even with those, often used options get put in our hard heads eventually. This isn't discounting the usefulness of braille, naturally; I find braille very useful, and in fact have the facility to produce it. There's free translation software, and more expensive translation software, and the hardware is also a bit expensive, but I do have it if anyone needs hardcopy braille. The Handi-Hams have a copy of this, as well, and have produced a DAISY file (which coordinates recorded text to speech in this case, with the text) and have made that available. Making a braille embosser ready file is also fairly trivial, so if anyone wants one, just holler :)

Anyway, thanks for the kind words, although I must say my motives aren't purely altruistic. As a blind ham myself, I'd love to see better documentation in general for a lot of stuff. Ever seen these manuals that say "Press the [picture of the button] button"? Totally useless. LOL

Buddy,

Point taken and I did not discount the abilities and memories of visually impaired people but they have to see/read it sometime somehow for a start. Off course there are always friends and relatives who can read it to them and, as you said, eventually they'll remember the important items or all of it. Keep up the good work.

73, Tony.

Of course, I'm assuming that a blind person that gets this document has an accessible computer. (I have about eight of them, three different operating systems, i.e. Windows, Mac, and Linux). So, yeah, if some blind person needs the doc and doesn't have access to a computer, I'm happy to provide in a hardcopy format.

Actually, Braille is going by the wayside lately. Most visually impaired people have computers, sometimes even supplied by the state that they live in. The file is in RTF format, something that most text readers should not have a problem with. The only thing that I can see that might help is to use the same common font in the entire document. This may make it easier for a text reading program.

I've learned through the years to never underestimate the capabilities of the visually impaired, especially hams. It would be good to forward a copy of this document to HandiHams. I've been a member of this organization for years and try to support them. This would be a great hand-held for them to suggest to their hams and this document would help them greatly. They might already be talking about the Wouxun products because of the built-in speech capability.

Oh, we're not going to get into a thingy on how relevant braille is or osn't here. Suffice to say, braille is as relevant to us as print is to you. That such a large part of our population is functionally illiterate is a travesty. Be that as it may, Handi-Hams has a copy of this.

"Collectors Edition", I like that.

I can see it now. The Home Shopping Network selling the last of my Copper Bezel-ed UV2D HT's. "Order now because after these are gone, there will be no more". A collector's item for sure.
Hummmmm.....

"Collectors Edition", I like that.

I can see it now. The Home Shopping Network selling the last of my Copper Bezel-ed UV2D HT's. "Order now because after these are gone, there will be no more". A collector's item for sure.
Hummmmm.....

Yeah, you do have to put in both. The software is a right royal pain in the ass with a screen reader, in part because you initially have to use the mouse navigation keys to initially focus the channel table, and also because it doesn't read the correct labels for the fields to edit, so you have to just sort of learn which things go where. It's maybe better to use the command line software that imports from and exports to a .csv file. I have it put together here somewhere to run in the Windows command line; will send the latest version I have put together for the Windows command prompt later on tomorrow.

Sounds good and yes it's something else isn't it as think they could have done better or need to figure out how to make it more accessible for us folks using the radio and software too.

That's great when you have time to send that to me.

Thanks.

Does anyone want to swap - I am a Stauffer ("Old Order") Mennonite and recieved a copper-bezel UVD from my distributor. My wife has had to knit a black wooley "sock" to cover the bezel, but it now tends to overheat if I transmit for long on the 5-watt setting. The matte black model would be more appropriate for us guys.

With both the UVD1 software and the UVD3 software, you type in the RX frequency, hit the TAB key once to move across to the TX frequency in the next column, and the software automatically fills in the same frequency as RX as "default". If you want to "split" you can then edit the appropriate digit(s) on TX.

My XYL also has a UVD and she's having trouble "personalising" hers. To make it easily distinguishable from mine, she's put "cat transfers" on it (she's a cat-lover to extreme). Unfortunately the only place on it with a nice flat surface is the battery, so when we fit the spare . . . . .

(I'm being serious in this post!)

But, if using a repeater freq the rx and tx won't be the same of course so wouldn't want both rx and tx the same in the software.

That's correct - if you want a repeater then you can "type over" the "default" TX frequency or, as I said below, edit it after you "tab". But that's a lot better than the alternative which is to type every frequency into the TX as well as the RX, whether repeater shift is required or not.

Subject: Re: [Wouxun_KG-UVD1] Programming frequencies and settings into the Wouxun dual band ht from the computer software

That's correct - if you want a repeater then you can "type over" the "default" TX frequency or, as I said below, edit it after you "tab". But that's a lot better than the alternative which is to type every frequency into the TX as well as the RX, whether repeater shift is required or not.

But, if using a repeater freq the rx and tx won't be the same of course so wouldn't want both rx and tx the same in the software.

Subject: Re: [Wouxun_KG-UVD1] Programming frequencies and settings into the Wouxun dual band ht from the computer software

With both the UVD1 software and the UVD3 software, you type in the RX frequency, hit the TAB key once to move across to the TX frequency in the next column, and the software automatically fills in the same frequency as RX as "default". If you want to "split" you can then edit the appropriate digit(s) on TX.

Stu

No - As per my initial mail on the subject - When you have entered the RX frequency you hit the TAB key, and that moved you to the TX frequency box, but it is automatically filled in with the same as the RX. The IF it is a repeater you can enter the TX frequency of edit the one that's already there. For simplex channels you can leave what has been filled for you and move to the rest of the fields.

I'll bet somebody in "Marketing" will have read that post and we'll see those pink, candy-striped, wood-grain and metalflake-apple covers on the market pretty soon.

But they will probably be for KenYeasCom radios and cost $100 a pop!

Well there is no new style bezel, until I market my pink, proceeds-to-breast-cancer bezel and my birthstone series bezels ;-)

The bezel will pop off the radio body but it leaves several holes in the case where dirt and gook could get in. I never thought it looked that bad but Wouxun sent me some in all black case by mistake, so I just switched. If you really dislike it that much, I'd take it off, rough it up with very fine sandpaper and paint it.

The alternative is to replace the front with one of the all black ones. I hate to even say this and get this started, but I will check on the costs of black fronts if this is a major issue. It's not a totally simple job but not too hard to replace.

What have I done ;-)

Sorry to hijack the thread with another question, but it is I thik relevant.

If I am using a repeater channel, is it possible to listen on input to the repeater by just pressing a couple of buttons or should I program that into a channel using the software?

Jim

No - As per my initial mail on the subject - When you have entered the RX frequency you hit the TAB key, and that moved you to the TX frequency box, but it is automatically filled in with the same as the RX. The IF it is a repeater you can enter the TX frequency of edit the one that's already there. For simplex channels you can leave what has been filled for you and move to the rest of the fields.

Ed,

You have really opened up Pandora's box now. You think keeping radio accessories in stock is fun; you are in for a ride trying to keep bezel options available in all vibrant colors, designs, grips, leather and other sweet feels, etc.

I'd like a western edition with leather, rawhide whipstitching on the sides, and imitation bull horns as dual antenna. What say?

Ed

I have the manual in front of me on page 7. I can't see any reference to reversing the TX/RX frequencies (although it does tell you how to reverse the direction of scan). And I've just tried both suggested methods above (a quick push of the scan key just starts the scan).

And in the case of the UVD manual I'm afraid it IS a "funny manual" (I'm sure that's the same word I'd have used ;-)

BTW - You mis-quoted - the maxim is "IF ALL ELSE FAILS, rtfm"

Anyone got any ideas that DO work? (apart from programming an "R" channel for the repeater reversed - I've tried that and it does work)

Pressing the SCAN button briefly will reverse the freqs and display an "R" at the top of the display letting you know you have reversed the frequency polarity.

>
You must hold the Scan/* key in until you hear the voice prompt which will say "Scanning begin" to start the scanning. To change the direction of the scanning you press and up or down button. This is for scanning, not reverse receive.

But Page 41 states the procedure to go to the reverse. Operating reverse frequency function: In standby mode press Scan/* to turn on the reverse frequency function; press Scan/* again to turn off.

Ed, I guess there are people out there who are not into a little change of style in their life. Pure black is okay, we need a little life in the party. As for pink and polka dots, not for me, but a simple difference in the color makes it easier on the eyes and brain to equate that the radio is for a given band. We have a few 220 machines in this are and I have them all programmed in with select 2 meter machines, and the memory id full. I was happy when I got the copper bezel 144/222 radio from you as I stated in an earlier post. It helps me identify the radio/band I am using. I have two more I bought through you for 144/440 that I am also satisfied with. Those two have fully loaded identical memories so I can recall a frequency via the memory number.

Ah - Page 41!

Yes, a quick push of the scan/* button on the keypad (NOT the PF1 side-button) does do it. That's where this board is so good :-)

A much better solution than allocating an adjacent channel to Reverse Repeater. I'd never been too sure of what "standby mode" meant - after experimenting with that I now understand that means not transmitting, and not programming.

If only the manual was better-written!

Thanks!

Not that I want to interrupt this vital discussion of radio front colors, but I have a programming question.

It appears that the selections on the Options page of the software do not have much actual effect. For example, on the Options page, I have a PL setting of 89.5, yet all my channels with their different tone settings seem to be working just fine. In fact, another setting of the Option page has my tone settings as OFF, yet all the channels seem to work with their assigned tones.

So what do the selections on the Option page mean??

Thanks, and Happy Holidays to all.

Ber in mind that CTCSS encode and decode are set completely independently; thus, one can be off, the other on, or both on with different values.

That sounds very strange Bob. My .tw file has some repeaters with COD column (CTC TX) set to 82.5 and some set to 110.9 But I don't have DEC (CTC RX tone) column set on any of them, and of course there's no CTC tones set on the simplex channels. All seem to work "as advertised"!

From the first two answers to my post, it appears that my post wasn't clear.

I am speaking about the fact that page two of the setting software, listed as Options, seems to have no effect on the settings on page 1, the spreadsheet.

I have no problem setting xmit and rcv frequencies and encode/decode tone on the spreadsheet. But when I go to page 2, Options, even if my TX-CTCSS and RX-CTCSS settings are OFF, the repeaters seem to work.

So my question is.... what do the settings on the Option page mean?? They don't seem to control anything... do they??

Bob

3795. Current drain on power off

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-12-23 21:30:34 UTC
From: David A. Behar
Topic: 3795 Message: 3795

Hi friends,

I seem to recall that somebody had reported that there was some power drain on the Wouxun radios when power is turned off, and I seem to recall that the reported drain was 8 milliamps, but I can't find the post.

So I finally got around to measuring the drain on power off on my two radios, and on both it was only about 1.55 ma. At this rate about 20% of a fully-charged 1300 mah battery's capacity will drain in a week.

Has anybody else tried to measure current drain when the power is off?

David

3797. 1 Button Simplex mode and busy channel lock out?

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-12-23 23:35:41 UTC
From: MichaelB
Topic: 3797 Message: 3797

I am finally getting a handle on programing the radio but I have a couple of questions that I can't find any answer too in the manual or cheat sheet.

1. Is there a one button or two button command that will turn a memory channel into symplex? I know about the reverse button.

2. Is there a way to lock out a channel because it is always busy (IE: the WX channels) from the scan opperation?

3. Does the CTCSS SCAN mode work from the VFO mode or the Channel mode or both? I can't seem to get it to work at all either way.

Hell of a radio for the $. Needs a tweak of the opperating system and software here and there and the manual is a typical translation fubar but hard to beat for the bucks. I am becoming happier with my choice every day.

OH, BTW, I have been using the rig for two days on the original charge!! No rig I have ever owned would do that.

I can see a 220 rig in my future.

Now, if they ever make a quad band VHF/UHF mobile or portabel or both, 50, 144, 220, 440, then I will want one! ;>) Just wishing.

I think you can only lock out channels by programming them not to scan in the software, it's one of the dropdown list boxes. As for CTCSS scan; it only works if the output of the repeater transmits a tone, but even so, I've never played with it on this radio, sorry. Yep, helluva radio though.

Oh yeah. Forgot. Short of going to dealer mode and reprogramming the channel, there's no way to change the offset to simplex. More's the pity, sometimes it's pretty useful. However, ifyou have need to do this, do it this way:

While holding down the 8 key on the radio, turn on the power.

Then type in
268160

You can then modify memories as you like, until you next turn the radio off. Then it reverts back to non-dealer mode.

From: Garrett
Topic: 3803 Message: 3803

I ordered a KG-UVD1P from cheapham.com on 12/21/10 and it arrived on 12/23/10 by Fedex! They sell them at $99.95 plus shipping, which was $10 for me. This basically matches the Hong Kong prices, and even beats them if you order more than one radio, all from a US seller. The radio I received is the 420-520 version, and it was locked to the ham bands, which was easy to open up with the unlock software. They also have the 220 version for the same price. I highly recommend this seller at this price point!

It dose not matter how cheap you find them.
The most important thing is customer service and Ed is tops in that aspect
.

In a message dated 12/23/2010 7:59:52 P.M. Eastern Standard Time,
blaster668@hotmail.com writes:

I ordered a KG-UVD1P from cheapham.com on 12/21/10 and it arrived on
12/23/10 by Fedex! They sell them at $99.95 plus shipping, which was $10 for me.
This basically matches the Hong Kong prices, and even beats them if you
order more than one radio, all from a US seller. The radio I received is the
420-520 version, and it was locked to the ham bands, which was easy to open
up with the unlock software. They also have the 220 version for the same
price. I highly recommend this seller at this price point!

Nah. Far as I know, it just allows you to modify the contents of memory channels.

Now there is one thing I'm curious about. Cheapham and also Powerwerx sells a cloning cable, presumably to clone one HT to another. How does this work? How does one initiate the cloning process? Unfortunately, SC Ed doesn't offer this cable, at least, not that I've seen. Not that I have much occasion to use such a thing, but could be useful, anyhow.

What is the unlock software intended for and does it expand the tx and rx outside of the ham bands?

If so where do you download it from?

The unlock software just expands the range of the radio to its full limit. Most of the ones sold here in the US are programmed to transmit only in the ham bands; the unlock software can change those limits. It's on the Yahoogroup, or get it here:

http://dl.dropbox.com/u/1053407/1KG-xxx%20unlock.exe

Bear in mind that your radio won't work outside its design spec; in other words, if you got the one with the 350-470 UHF band, it won't operate properly above 470. Or, if you got the 420-520, it won't operate properly below 420.

Buddy,

It's described on page 43. I have included a screen shot in this text but I'm not sure if that is of any use to you. It basically says. "once you have connected the two radios together with the cloning cable and turned on, push the MON key on the source radio and cloning starts.

Tony.

Mostly the Options menu is for Display purposes and default settings. There are drop down menus for the various functions you may wish to set as defaults, such as the Channel Display. When you want the Channel + Frequency you choose that. Once you have set what you want, you save the file to whatever you named it, along with the frequencies, tones, etc. before you upload to the radio. You can do whatever you want with the settings. I prefer some things you may prefer other things, there are no set rules to follow. It's all customized by you.

I think you'll find that the settings on the Options Page you're talking about refer to the default settings you'd like applied to the "Frequency A" and "Frequency B" modes. These are what's normally called VFO mode for each side of most dual band radios. So the frequencies, CT codes, etc. that you preset are what will appear when you switch to Frequency Mode. Hope that helps to clear it up!

Dan

From: Keisha
Topic: 3803 Message: 3820

How to use the wire-clone function for KG-UVD1P?

1.There are two radios needed and the wire-clone cable, the source radio sending all the settings and parameter to other radios, and the target radio cloned with all the setting and parameter from the source radio.
2.Install the battery pack on source radio and the target radio, and then connect them with the wire-clone cable.
3.Power on the target radio
4.Then power on the source radio, while hold on the MONI key at the same time.
5.Red LED on the source radio keeps flashing, while the green LED on the target radio also keeps flashing, which shows the wire cloning is completely proceeding.

The red LED of source radio indicates different status as follow:
1.When wire-cloning is proceeding and sending the data to the target radio accordingly, the red LED keeps flashing.
2.When the wire-cloning completes, the red LED distinguishes, and the source radio is back to the standby mode.
3.When the wire-cloning fails, the red LED is on, and the source radio is back to the standby mode.

The green LED of target radio indicates different status as follow:
1.When wire-cloning is proceeding and receiving the data from the source radio accordingly, the green LED keeps flashing.
2.When the wire-cloning completes, the green LED distinguishes, and the target radio is back to the standby mode.

> Now there is one thing I'm curious about. Cheapham and also Powerwerx sells a cloning cable, presumably to clone one HT to another. How does this work? How does one initiate the cloning process? Unfortunately, SC Ed doesn't offer this cable, at least, not that I've seen. Not that I have much occasion to use such a thing, but could be useful, anyhow.

Fedex! They sell them at $99.95 plus shipping, which was $10 for me. This basically matches
the Hong Kong prices, and even beats them if you order more than one radio, all from a US
seller. The radio I received is the 420-520 version, and it was locked to the ham bands,
which was easy to open up with the unlock software. They also have the 220 version for the
same price. I highly recommend this seller at this price point!

3821. KG-UV920R: on sale now for about $220

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-12-24 03:13:16 UTC
From: someonear
Topic: 3821 Message: 3821

On this Ukrainian site the KG-UV920R is priced at 2400 Hryvnia, or US$305.
In comparison, the KG-UVD1P is 1100 Hryvnia, or US$140. Extrapolating this to the US market where the KG-UVD1P is available for $100-$108, this would be about $218-$235 for the KG-UV920R --a bit much for an unknown unit... your frequency may vary.

I really don't see the big deal here...I have a "collector's edition" copper front KG-UV2D, and it really isn't all that noticeable...yeah, a little shiny, but it's not like it's really BRIGHT copper...just a little "bling", no big deal. I like the idea of it becoming the "COLLECTOR'S EDITION"...but all in all, it works the same.

Ditto here. I have ordered many items from Cheapham.com over the years.
Always had great prices and service on all of their product lines.

Over the years I have ordered many items from these folks, Heil, LDG, etc.

Great prices, great customer service. They always get excellent reviews.
Tend to be price leaders on all of the product lines they sell.

The unlock software just expands the range of the radio to its full limit. Most of the ones sold here in the US are programmed to transmit only in the ham bands; the unlock software can change those limits. It's on the Yahoogroup, or get it here:

http://dl.dropbox.com/u/1053407/1KG-xxx%20unlock.exe

Bear in mind that your radio won't work outside its design spec; in other words, if you got the one with the 350-470 UHF band, it won't operate properly above 470. Or, if you got the 420-520, it won't operate properly below 420.

I noticed they also sell the Uvd2 with the copper cover. I hope the 920R is reasonably priced. $305.00 isn't a bad price for this but may stop some from buying it. I like the $220.00 range better mind you.

Remove the battery and read the label. It should tell you the ranges.

Ok mine won't go any lower then the 136.025 on vhf and will go above 450.000 as can listen to 460.xxx for our local sheriff freqs here in Pensacola Florida.

So wondered with that unlock program if would allow for being able to go below 136.xxx so could tune in the aircraft freqs without affecting the vhf 2m ham bands?

Attachments: 2 described; binary payloads are missing from this source WARC

Well if could see to read them would; but, looks like according to the default freqs when loaded into the programming software the ranges are vhf 136.xxx and above and uhf 350.xxx and above.

Remove the battery and read the label. It should tell you the ranges.

Nice in theory, but I reckon Don will have to have someone read the label to him. A dicey proposition at best. "I'm looking for what?" LOL

Well this Ed DOES offer the cable for $10 plus $2 shipping.

Now there is one thing I'm curious about. Cheapham and also Powerwerx sells a cloning cable, presumably to clone one HT to another. How does this work? How does one initiate the cloning process? Unfortunately, SC Ed doesn't offer this cable, at least, not that I've seen. Not that I have much occasion to use such a thing, but could be useful, anyhow.

This basically matches the Hong Kong prices, and even beats them if you order more than one radio, all from a US seller. The radio I received is the 420-520 version, and it was locked to the ham bands, which was easy to open up with the unlock software. They also have the 220 version for the same price. I highly recommend this seller at this price point!

It definitely won't go below 136.000.

Useful link Buddy - but note that the plastic case is called "Radio Chassis"

I wondered if they had a spare belt clip (but they don't). My XYL dropped her rig and did no damage except to break the belt clip. She's now using our spare battery, but it would be nice to have a belt clip on all of our batteries. (Though I've never had to put a "spare" in except to periodically make sure the battery is charged!)

Copper finish? I suppose it might slightly increase the ground-plane size ;-)

Here is the link to spare parts on the 409shop.com page. It looks like a new case is $8 shipped there. http://www.409shop.com/409shop_shopcat.php?&usercat=2085&parentid=1693

I'd say that around US$220 is a fantastic price if this is the new 2-band mobile that many of us have been waiting for! Remember that the UVD1P was a relatively "unknown unit" when most of us bought it!

But I don't think I'll be rushing to buy one from Ukraine.

I'm wondering why none of the usual vendors are selling them yet on eBay.com - or why the Eds haven't got them yet? Maybe something fishy about the Ukrainian offer?

Subject: [Wouxun_KG-UVD1] KG-UV920R: on sale now for about $220

On this Ukrainian site the KG-UV920R is priced at 2400 Hryvnia, or US$305.
In comparison, the KG-UVD1P is 1100 Hryvnia, or US$140. Extrapolating this to the US market where the KG-UVD1P is available for $100-$108, this would be about $218-$235 for the KG-UV920R --a bit much for an unknown unit... your frequency may vary.

I see same effect here. If I leave the radio turned off fully charged, after about 3 to 4 weeks of non use, the battery is dead flat. Whereas my spare battery still has lots of charge. I havnt as yet measured the current drain while the radio is off, But I would assume mine to be in the order of 2- 5 ma. This is a bit strange really because looking at the circuit diagram, the battery looks to be totally disconncted from the radio with the vol on/off switch. There must be something else going on within the circuit that isnt shown on the circuit diagram.

Subject: [Wouxun_KG-UVD1] Current drain on power off

Hi friends,

I seem to recall that somebody had reported that there was some power drain on the Wouxun radios when power is turned off, and I seem to recall that the reported drain was 8 milliamps, but I can't find the post.

So I finally got around to measuring the drain on power off on my two radios, and on both it was only about 1.55 ma. At this rate about 20% of a fully-charged 1300 mah battery's capacity will drain in a week.

Has anybody else tried to measure current drain when the power is off?

David

No - these radios will not work outside their HARDWARE design limits (which depend on which version you have, but none of them goes down that low)

Unless USA is different to Europe, the UVD is an FM radio - air band is AM. You'd not be able to hear much! You can buy an AM radio that recieves air band for as low as $15 to $45 (on eBay)

3846. Frequency Coverage

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-12-24 07:37:21 UTC
From: Stu Nutt
Topic: 3846 Message: 3846

Reiteration - and a bit more information:

(Note that if you buy a radio that is locked to your country's ham bands, many of these comments only apply if you have "unlocked" them - I understand that is quite a simple matter and the program is posted in the "files" section for this group. (I bought mine from China before they became available from UK/US distributors, and so was already "unlocked")

These radios (even unlocked) will only tune to the bands that are specified for. In fact, they only go to the exact upper frequency shown on the label on the radio beneath the battery - i.e. the "350-470" version, for example, goes from 350.000 to one step below 470 (see label on yours when you remove the battery).

If someone writes new firmware for them, you could maybe get a bit further from the design band edges, as the RF side appears to be very wide-band; mine shows near enough the same power output at the band edges. It will not accept any frequency that you try to punch in outside of its spec - even for RX. But writing that firmware (and incorporating everyone's "wish lists") would be a big job, and you'd probably have to remove an SMD ROM and solder in a new one, and all the "wish lists" may not fit in the memory size available!

Receiving AM transmissions (like Air Band) would require a serious hardware mod (adding an AM detector and a way of switching between this and the FM discriminator!). I know we are hams and are supposed to know how to use a soldering iron, but I'd certainly not like to try on a piece of kit this miniaturised.

They are capable of transmitting and receiving on any frequency covered by the version you bought (see label below the battery). This covers many other applications, as we have seen here from the discussions about fire crews etc. If you want to know what is on those bands in your area, go to Frequency Mode an initiate a scan! (If you want to use them for other "business radio" type applications check what frequency is required but I suspect they will cover most)

I know that they all cover the European "PMR446" channels (around 446MHz), although they are not "legal" in that, even on low power setting, they exceed the 500mW limit and have "removable" antennae. However I have added the PMR446 to my memories for use in "emergencies" to be able to work a "446" user if need be (Raynet). It will also cover USA FRS (around 462MHz) with the same "legal" reservations (for RACES etc). I have tested use with FRS frequencies, but I don't use them as I have no idea to whom 462MHz is allocated to in UK! (I have a pair of Binatone FRS radios that I used in USA during my frequent visits to my daughter in PA).

As GMRS frequencies are same/similar to FRS, they should work on there too (but check legalities)

These are VERY versatile little rigs, but I don't think that trying to significantly modify them (or to get them to do something they were not designed for) is a wise, or feasible, idea. Having said that, mine also get used for APRS with a suitable lead made to connect to my KAM-4 TNC; I haven't tried Digi-Mode yet!

The UVD is a lovely rig, with plenty of facilities ("if only I could understand the manual"!!) and a bargain for $100 - $150, but don't expect everything you'd want from a rig for which you'd pay 4 times the price.

Have fun!
Stu

Ok mine won't go any lower then the 136.025 on vhf and will go above 450.000 as can listen to 460.xxx for our local sheriff freqs here in Pensacola Florida.

So wondered with that unlock program if would allow for being able to go below 136.xxx so could tune in the aircraft freqs without affecting the vhf 2m ham bands?

Also I did recognize the accu discharging when the KG-UVD1P was unused and just layed in my car.

By having a closer look to the schematic, the only reason can be that SMD capacitor C622 (10nF or 0.01mF) has a leak current. This is the ONLY part which is in parallel to the accumulator when ON/OFF switch is on OFF position.

I didn't try this mod yet but I'm quite sure it will work 100%. Just remove C622 on the down side of the PCB. To prevent RFI into the accumulator, just add another 10nF/0.01mF capacitor - but on the SECONDARY connector of the ON/OFF switch. This can easily be done on the upper side of the PCB where the 2 connectors of the ON/OFF switch have one soldering blob each.

vy 73, good luck on modding + Merry Christmas
Jochen (DG2IAQ)

BTW, for the moment I "fixed" the leak current problem by just removing the accumulator from the KG-UVD1P while it just layes in my car. A removed accumulator will NOT discharge !! Or it only discharges on its own technique, but Li-ion accus have a quite small discharge rate.

I've got one KG-UVD1P with a window-mount antenna form Kathrein as my "mobile" rig. As I use the 12V car adaptor here, the leak current is not a problem.

Only on my second KG-UVD1P, which is just im my car for emergency usage or just for fun on hiking tours, I removed its accumulator while being not used.

Nevertheless I will try the C622 fix for sure. If it will work - I'll can keep the accu on its "origin" place. :-)

vy 73,
Jochen

> By having a closer look to the schematic, the only reason can be that SMD capacitor C622 (10nF or 0.01mF) has a leak current. This is the ONLY part which is in parallel to the accumulator when ON/OFF switch is on OFF position.
>
> I didn't try this mod yet but I'm quite sure it will work 100%. Just remove C622 on the down side of the PCB. To prevent RFI into the accumulator, just add another 10nF/0.01mF capacitor - but on the SECONDARY connector of the ON/OFF switch. This can easily be done on the upper side of the PCB where the 2 connectors of the ON/OFF switch have one soldering blob each.

> > I see same effect here. If I leave the radio turned off fully charged, after about 3 to 4 weeks of non use, the battery is dead flat. Whereas my spare battery still has lots of charge. I havnt as yet measured the current drain while the radio is off, But I would assume mine to be in the order of 2- 5 ma. This is a bit strange really because looking at the circuit diagram, the battery looks to be totally disconncted from the radio with the vol on/off switch. There must be something else going on within the circuit that isnt shown on the circuit diagram.

Nope. Just press the * key, and it will flip over to the input.

Look closer :)

Battery power signal before switch is named "BATT+" while after switch
it is named "BATT". Look at U616 - it's a voltage regulator connecting
to "BATT+" and producing "5M" power signal to power the MCU.

MCU is always powered on, but I guess that most of the power drainage is
done by the U616 itself - current MCUs can be really economic in sleep
modes, while power regulators are not.

That's a "battery WITH belt clip" - I don't need another battery - indeed I'm not sure I really need one spare! I was hoping to find just a belt clip to replace the broken one on the battery we have, just in case we actually need to use it!

I'd say that around US$220 is a fantastic price if
this is the new 2-band mobile that many of us have been waiting for!
Remember that the UVD1P was a relatively "unknown unit" when most of us
bought it!

But I don't think I'll be rushing to buy one from
Ukraine.

I'm wondering why none of the usual vendors are
selling them yet on eBay.com - or why the Eds haven't got them yet? Maybe
something fishy about the Ukrainian offer?

Subject: [Wouxun_KG-UVD1] KG-UV920R: on
sale now for about $220

On this Ukrainian site the KG-UV920R is priced at 2400 Hryvnia, or
US$305.
In comparison, the KG-UVD1P is 1100 Hryvnia, or US$140.
Extrapolating this to the US market where the KG-UVD1P is available for
$100-$108, this would be about $218-$235 for the KG-UV920R --a bit much for an
unknown unit... your frequency may vary.

There's a link for just the clip (second in the list). I added the battery with clip link (the last/third link) since the clip-only listing didn't explicitly list the dual-bander. But the models listed in the third link (battery&clip) seem to be using the same battery as the dual-bander and therefore the clip should be interchangeable.
If you have the patience to wait three weeks (as I do), the shipping is included in all their prices!

I had the XYL look at that pink 'collector's edition'.=
Amazing, a new record: she spent nearly a full second looking at a radio!

Speaking of paint, is the 'new' all-black KG-UV2D sporting a painted trim or is this an all-black plastic material like the housing itself?

Thanks.

The new all-black does not have a bezel, it's like the housing.

Ok, I have missed something. I got my radio and tried to program it. Software read the radio fine. I had to unlock it to use my frequencies (151.5125, 158.4075, 158.4). Put them in and wrote to the radio. Turn on radio and they are not there. The upper freq as changed to174 and470. What did I miss???

Thanks,

Jim

I'll second Mr. Fisher's recommendation for the NA-771. For its size, it performs very well. Good advice from other posts is screwing in a SMA to BNC adapter will keep wear on the SMA connector down and allow you to change antennas quickly.

3872. Re: [Wouxun_KG-UVD1] Re: antenna options?

Got it working somewhat.

Question on capability, the one frequency, 151.5125 and 158.4075 semmto not work. Are the radios capable of those frequencies? Also I try and set the step to 5k abd it goes back to 12.5.

Thanks

I've been using the Pryme RD-98 (BNC) with a female SMA to BNC adapter and it works very well. I bought it based on recommendations from some very knowledgeable hams as well as online reviews and have not been disappointed. I recommend the adapter sold by Wouxun.us because it fits snugly and securely to the radio whereas others stand way out from the radio.

That one is SMA-Male - you will need an adapter as the Wouxun takes an SMA-Female.

But why change what you have? I bought a replacement antenna that's about 20" long, figuring that "twice the length is twice the capture area"; it made no apparent improvement in signal and the extra length just got in the way if I had the radio inside a coat, and tended to poke into peoples eyes if I had it in my hand!

Thanks for the info - looks like there's clips available from several sources; Ed (Griffin - Wouxun.us) offered to send me one from USA, shortly followed by Ed (Greany) who also has them in stock at a very reasonable price - Many thanks to both.

Amazing isn't it - I have several times clipped my rig onto the OUTside of a jacket pocket, and it has dropped - bouncing off the ground only slightly restrained by the elastic effect of the speaker-mike, and the only result is the battery-pack being knocked off. Give one to the XYL and she promptly drops it and breaks the clip! Given the reports in the past of folks dropping the rig, driving over it with a car, falling out of canoes with it, and them still working, can we nominate my XYL - Amanda, M6AIW - as the first to find the rig easy to damage? Hihi!

The BNC adapter is good advice (in my opinion). I've done that on both our radios and I even fitted a "reverse" BNC adapter onto my stock antenna to make it "quick-release". Our home-station 2m/70cm antennas and the mobile all have PL-259 plugs and we have further adapters to connect these to BNC.

I know that adding the 259 adapters is not the best RF practice, but our "base" radios have 259 and doing it this way means that we can quickly connect any radio to any antenna. I was concerned that repeatedly screwing and unscrewing on the antenna socket would not do any good - especially with "M6AIW" involved, who is totally mechanically disastrous and would probably cross-thread the SMA. (She once complained to me that she "couldn't get the printer to plug into any port of one of our lap-tops however hard she pushed" - my reply was "no love, you have to put a USB plug the right way up, or it damages the socket" - and it had!)

I bought a replacement antenna that's about 20" long, figuring that "twice the length is twice the capture area"; it made no apparent improvement in signal and the extra length just got in the way if I had the radio inside a coat, and tended to poke into peoples eyes if I had it in my hand!

Topic: 3866 Message: 3884

MTC is where I bought my HT and I am well pleased with their service! They didn't have the antenna listed when I purchased. I saw the comment here about the antenna from 490 Shop and I ordered one. The one MTC now has looks very much like the one I have. Getting one from 409 Shop took a few weeks to come. If you order from MTC you will have it in a couple of days, instead of waiting weeks.

Yeah seems that that freq will not go in for some reason. Too bad since
that is one our assigned freqs.

Got it working somewhat.

Question on capability, the one frequency, 151.5125 and 158.4075 semmto not
work. Are the radios capable of those frequencies? Also I try and set the
step to 5k abd it goes back to 12.5.

Thanks

Keisha,

I order the 136-174 350-470 Radio.

The radio body says 144-147.995 420-449.995

We are a small volunteer search and rescue team (bloodhounds) and these radios really make things easier because of function and price. To see more of our team, www.bayk9sar.org.

Do I need to return and get a different model?

Thanks,

Jim

I would recommend that any external antenna with a PL259, or type "N", connector be hooked up to a hand held radio with a 2 or 3 feet extension with the right connector, or adaptor, and have the extension of light weight cable such as RG-58 to keep the strain off the handheld.

With such a short cable of small diameter you can ignore the amount of loss in that cable.

Tony.

Here's some more options:

Antenna
I have antennas from prior handhelds that have a BNC connector. My favorite antenna is the Diamond RH77CA
it is a great antenna to have with you for when the signals become marginal. See the reviews on this
antenna http://www.eham.net/reviews/detail/1340

Adapter
I bought this adapter from Powerwerx so I can use this great antenna and other BNC antennas I have.
http://www.powerwerx.com/wouxun-radios/wouxun-reverse-sma-bnc-antenna-rf-adapter.html

Merry Christmas everyone !

I really don't know why the stock Wouxun antenna is not the antenna of choice.
After all, it is supplied by the manufacturer of the radio to begin with and it stands for Wouxun to be pleased with their sales and performance of their radios they would provide adequate antennas, batteries, etc. to complete the whole package.
I operate with the stock antenna and am completely satisfied with the results and I operate (and own) repeaters in Southern California without any problem with repeater or simplex operation.
For what it's worth, I also carry an adequate stock of Wouxun SMA-BNC adapters for $7 each.
Merry Christmas and I hope Santa brought everyone the radio of choice this year. Mine is the UCD1P.

Longer is not necessarily better when it comes to performance. I keep telling my wife that too. However, for times when you desire a little longer performance, you might consider a BNC connector with a short coax to a hi-gain mobile antenna either handheld or with a mag mount. I can agree with you that some cases holding the radio as high as you can using a speaker mic gets you out better also. It's all about height and gain.

Ed,
Size does matter. Higher gain requires greater antenna dimensions. On the other hand, just going longer does not necessarily produce higher gain. I have tested many of the longer HT antennas and they do vary in performance. Generally, the 1/2 wave designs are superior since they don't require a ground plane. As I said earlier, your typical rubber duck is a poor performer (but very handy).

A mag mount mobile antenna is an excellent choice for mobile applications.

For hiking, backpacking or doing mountaintop operating, a telescoping antenna is an excellent choice. See http://www.14er.org/gain.php

Huh?
The factory antenna will work ANY repeater especially (as you say) local ones.

Please explain what local repeater you have that the stock antenna won't access under conditions that an alternative antenna will access. I need to understand.

Ed

Jim the radio you have is the version you ordered. The radio and box are labeled 144-147.995 420-449.995 because that is the way Wouxun has labeled such radios that transmit only inside the ham bands. This will change soon when they start labeling BOTH transmit and receive ranges.

Your frequency of 151.5125 can be programmed if the STEP is set to either 6.25 or 12.5.

To program 158.4075 you would need a STEP size of 2.5, which the Wouxun will not do. This is something I have been pointing out to them for a year. You can find other threads in the archives on this subject. If you divide the frequency (in MHz) by the step size (in MHz) and get a whole number, you will be able to enter that frequency. If you get a decimal-number, it will not enter.
151.5125 / .00625 = 24242 (OK) but 158.7075 / anything but .0025 = not OK.

The reason you did not see the channels you entered after turning the radio on is because you were in Frequency Mode not Channel Mode. If you press MENU + TDR, the radio will cycle to the opposite mode and you will see your saved memories (channels, as Wouxun refers to them).

Regards,
Ed Griffin

Hi Ed,

Although I'm not William Fisher, I will say that there is a repeater
that is about 60 miles from me (as the crow flies). It's about 1800
feet up a 2000 foot tower. I can hit it with my mobile, but not with
my handheld. At least not until I put an extendable metal antenna on
it, and then I can -barely- get into it.

Useful during an emergency, but hardly worth the trouble of carrying
it around attached to the radio all the time.

Another useful device I haven't seen mentioned is a "tiger tail". They
were available commercially for awhile, but as people saw them in
use, they discovered it was little more than a piece of wire with a
crimp-on ring on one end. It's easy to make one. Approx. 19-1/4
inches of wire with a ring on the end that can slip under your antenna
and make contact with your radio's ground (chassis). You can also
connect it to just about any exposed metal part of a radio, however,
I don't think the physical design of the Wouxun radios will allow them
to work with this device.

When you input the frequencies, tones, etc. into the program file and then save it you then plug in your cable to the computer, then the radio and then you click Program and choose Write To Radio, then turn the radio on. If successful you will see the LED's flash and then get a windows message stating success. Are you saying the frequencies you entered don't show in the memories you chose, or that none of the file downloaded to the radio? You make your posting unclear.

With those frequencies, did you actually see that the frequencies were entered exactly as you entered them? You have to change the step to 6.25kHz. to enter those frequencies, otherwise the radio/[program will present a 5kHz. frequency.

Will change the step.

Yes it sent the data to the radio.

Operator error from that point on.

From: Lyman Lyon
Topic: 3889 Message: 3906

I have yet to get the adapter to try it on my Wouxun, but on my Yaesu VX-8R the Diamond SRH320A performs significantly better than the antenna that came with the Yaesu. One reason for not including something similar with the radio is that it is an unhandy, but more efficient, 13 inches long. The other reason is that just the antenna alone costs about half what a Wouxun transceiver sells for. The SRH320A is a tri-band, which is over-kill for the Wouxun. But, I would not be surprised if a longer, more carefully built dual band antenna would not be an improvement over the stock antenna. Which probably won't matter much if you are close to a lot of repeaters.

I really don't know why the stock Wouxun antenna is not the antenna of choice. After all, it is supplied by the manufacturer of the radio to begin with and it stands for Wouxun to be pleased with their sales and performance of their radios they would provide adequate antennas, batteries, etc. to complete the whole package.
I operate with the stock antenna and am completely satisfied with the results and I operate (and own) repeaters in Southern California without any problem with repeater or simplex operation.
For what it's worth, I also carry an adequate stock of Wouxun SMA-BNC adapters for $7 each.
Merry Christmas and I hope Santa brought everyone the radio of choice this year. Mine is the UCD1P.

Web,

This situation could be the sensitivity of the repeater or the HT on the Rx. 60 miles is not a distance for a repeater in my parts with lots of mountain tops for repeaters everywhere but in Kansas it could be a challenge even with a 2K antenna - which is huge!

I know of your tiger tail and they work great but of course don't have the elevation benefit when using them. I recall years ago (yes, I mean YEARS) Radio Shack used to sell a 4-ch police monitor - not scanner - which had a mini plug on one end of a simple single strand wire about 18" long. That was the entire antenna and it worked well however, they also had a stubby available for us professionals too shy to carry something with a string attached. :)

3909. HT antenna testing

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-12-26 03:48:44 UTC
From: w4yn
Topic: 3909 Message: 3909

A few (maybe 8)years ago our scout troop had just purchased a number of HT's and we wanted to maximize antenna performance. We often split into ability groups when backpacking and keeping in touch for emergencies, repeater or line of sight was important to us. We set up an simple antenna testing range and purchased a fair (12-14 if memory serves) ht dual band antennas. We tested each one with an antenna analyzer and on radio field range tests. It was amazing how many factory supplied (YeKeCom) dual band antennas had high SWR and poor performance on range test. We finally settled on Comet SMA 3 antenna. This antenna had low SWR on both bands and was also the best on antenna range field.

We have not repeated this but I would be glad to do this again when weather improves (July the way it looks this winter. I am sure the antennas that are available today will be quite different than what we tested back then. Still have a drawer full to start with and it includes some OEM antennas.

I would not go with anything that's not flexible able in case you snag it. The telescoping most times have to be pushed in so for one band then pulled out for others. consider a flexible antenna then when Mobile use a window mount http://cgi.ebay.com/ebaymotors/TNC-Over-Window-Edge-Antenna-Clip-Mount-Cable-BS56-_W0QQcmdZViewItemQQhashZitem19a376c229QQitemZ110116651561QQptZMotorsQ5fCarQ5fTruckQ5fPartsQ5fAccessories We use them on business band for plowing snow makes big difference to get it out side the trucks.

Ed
for the same reason the sell them with the small battery so you can upgrade. But More so because the stock antenna is a wide range transmit antenna if you get one for the ham band only its tuned better. I do find that when in the car the stock antenna works better because its shorter than my after market and I can hold it strait up and down. I use the after market when plowing on a over window mount Because the mount is a stander SMA and I don't want a adapter hanging of a mount and because if I hit a tree I don't want to break a factory antenna

I'll endorse what Ed said, and the information in Bob's link. I've mentioned before that I bought a "longer" antenna for my UVD1 and SUBjectively (I haven't taken any accurate measurements) this is no better on 2m than the one that was supplied with the radio. Remember that the "rubber duck" is definitely a compromise that allows you to carry the radio around conveniently, and that its "ground plane" is just the chassis of the radio (about 4" high) with probably the operator's body capacitively coupled to that. (Has anyone tried adding a 19" wire "tail" connected to the screen of the antenna connector?)

My XYL uses her UVD1 as her "main rig" as she has a Foundation License, and is limited to max 10 watts. For "fixed" operation she has it hooked to a Slim Jim and there is obviously much better range obtained with that half-wave up in the sky compared with the "stubby" at ground level. When I go mobile, I rarely bother bringing the FT-857 out of the shack any longer; for most contacts the UVD1 connected to the car's mag-mount is plenty to work all the local repeaters and simplex stations, including my wife's UVD1 with the Slim Jim. Obviously the Yaesu is "better" ($500-worth of gear, at "used" price), but only if the station at the other end is running 40-50 watts as well - there's nothing in it when you compare the sensitivity if the two receivers, the Yaesu only has the advantage of higher TX power.

Ed,
Size does matter. Higher gain requires greater antenna dimensions. On the other hand, just going longer does not necessarily produce higher gain. I have tested many of the longer HT antennas and they do vary in performance. Generally, the 1/2 wave designs are superior since they don't require a ground plane. As I said earlier, your typical rubber duck is a poor performer (but very handy).

A mag mount mobile antenna is an excellent choice for mobile applications.

For hiking, backpacking or doing mountaintop operating, a telescoping antenna is an excellent choice. See http://www.14er.org/gain.php

I have for years been using an AEA Hot Rod telescoping antenna on my various hand held 2 meter radios and it works quiet nicely. It is a bit big if you are going hiking or walking. I have an SMA-24 by Comet that is a very nice dual band antenna which is 17 inches that also gives me good results. I use it when I have an HT sitting on the bedside table or wherever I want to sit down and it does great. I have had it on the radios when I've gone for a walk and it helps since it has some gain too. I use various adapters for different radios and have no complaints at all. You wouldn't be walking around a flea market with something as big as either of these, that would be pretty strange.

Subject: [Wouxun_KG-UVD1] HT antenna testing

A few (maybe 8)years ago our scout troop had just purchased a number of HT's and we wanted to maximize antenna performance. We often split into ability groups when backpacking and keeping in touch for emergencies, repeater or line of sight was important to us. We set up an simple antenna testing range and purchased a fair (12-14 if memory serves) ht dual band antennas. We tested each one with an antenna analyzer and on radio field range tests. It was amazing how many factory supplied (YeKeCom) dual band antennas had high SWR and poor performance on range test. We finally settled on Comet SMA 3 antenna. This antenna had low SWR on both bands and was also the best on antenna range field.

We have not repeated this but I would be glad to do this again when weather improves (July the way it looks this winter. I am sure the antennas that are available today will be quite different than what we tested back then. Still have a drawer full to start with and it includes some OEM antennas.

Yes, they work. Just keep in mind that they're a "tuned counterpoise".
You have to have one cut near the frequency you plan on using, i.e.
you shouldn't expect fantastic results on 440 if using a 2M tiger tail.

Basically, they're an improvement over using your body for the "other
half" of a dipole antenna.

thankyou, its all pretty new stuff to me as i have read 440 band size would be 17cm ? , and so on for what band ya in? would be interesting to see some results, what would the gain go up by how much? double or far less?

Group,

Tiger tails do work. They are specific to one band. If you make one for 2 M, beware of it on 70 cm. I used one on 2 M and used the radio on 70 cm. The tiger tail does bite! It was a long time ago, but I do remeber inproved 70 cm perfornce, If you use it on a dual bander, insulate it! Be sure it works for you on both bands! I never did play with doubles (one for each band).

I have the 2 M/1.25 M version. I used the Diamond SRH320A on the UVD1. Tests were primarily on 1.25 M as that bis the band of interest for me. It works well, but did not offer significant advantage over the stock antenna. There was a very, very slight difference in what I would refer to as lobe effect. What that means is that the Diamond does not fade as much when you move around. The difference is so slight that I would not purchase the Diamond gor use on the UVD1. The very minor difference (really insignificant) does not justify the expense and the handicap of an adapter. For me, the antenna of choice is the stock antenna! It is quite nice to buy an HT with a well designed antenna so one does not have a compelling need to buy an after market antenna!

I may purchase a UVD1 in 2 M/70 cm and have an array of antennae to test on those bands. If I do, I will post results.

When programming the UVDP1, is it necessary to put the xmit CTSS tones when you program the receiving frequencies? I love my Wouxun, cheap and dependable, but impossible to program from the keypad. Has anyone out there re-written the manual so it is coherent?

Mark KE5JNS

In a message dated 12/26/2010 9:50:27 A.M. Central Standard Time, arxjmail@... writes:

I got the KG-816 in the 2m version. $79 shipped (409shop.com). It works far beyond my expectations! Tough too (dropped it on a tile floor a couple of times, --not even a scratch!)

It is very similar to the dual-bander KG-UVD1P, incl. the same quirks for the most part. I love the thing, but:
--although accessories interchange with other Wouxuns, the batteries (and chargers) do not!
--can't find a battery eliminator (not sure if it even exists theoretically).

On the other hand the KG-816 does have a few features the dual-bander does not (currently) come with such as DTMF Decode (yeah, well...), and the 'stun', 'kill', 'monitor' options (discussed elsewhere on this list). Those can come in handy for some highly specific applications (like using the radio as a baby monitor on a MURS frequency perhaps).

I would suggest to spring for the extra $20 and get dual-bander which gives you the option of monitoring two frequency on the 2m band, if that's important to you. Most importantly, however, I would rate the price difference a worthwhile investment due to the ready availability of not on the unit itself, but the many accessories to chose from.

You could get the KG-699E ("Advanced", dual knob available at AsiaRadioSales and the single-knob "Advanced" is available at 888RadioShop) but the price now gets you even closer to as US-sourced KG-UVD1P than even the KG-816.

Whatever you decide, I consider the KG-816 a great gift and would not turn it down if it were given to me! That little HT would make a great companion to the Yaesu FT-1900R mobile for the new ham (and even seasoned one, since you just can't seem to have too many radios around!)

Hope that helps,
A.

Impossible to program with the keypad?! Wow, not hardly! Exactly what is giving you trouble with the keypad? See the eyes-free documentation on the group (in the manuals section). Even the light dependents have found this to be useful.

From: Clyde
Topic: 3909 Message: 3930

Better than spending money for those tiger tail things, a clip lead can act as a counterpoise. That is what the tiger tail is supposedly for. Just disconnect your antenna and wrap some bare wire around the connector and reinsert it attach a clip lead. But of course with either of these attached, you'll look like a goof ball.

3931. Scanning?

Yahoo group: Wouxun_Radios (2009 — 2010)

From: ben
Topic: 3931 Message: 3931

can this radio scan the 2 meter band or just what you have saved in it?

3932. Re: [Wouxun_KG-UVD1] Scanning?

Yahoo group: Wouxun_Radios (2009 — 2010)

From: Stu Nutt
Topic: 3931 Message: 3932

If you go into Frequency Mode (menu 21) it will scan through the entire range that it is programmed for. If you have one that's "locked" for the 2m band limits, presumably it would scan all of 2m. With my one that came from the factory (completely unlocked) it will scan from 136 to 175 MHz!

Stu

Hello, new to the group. I just purchased this little HT for $100 thru a group purchase via local clubs banding together to purchase some radios. I spent the last day programming local area repeaters. I will attach a file with the frequencies that I programed for the Las Vegas area. I encourage you to verify my work to assure that I have not transposed a tone or frequency. Use at your own discretion.

Looking forward to learning about my HT.

Thanks for the add to the group.

Thank you Dana, I saw on one of the cycle sites where someone had installed a mobile 2 meter on a goldwing and got it to work in place of the cb, but can't find the site again. I have a throat mike from radio shack but it w on't fit the wouxun but will work on my alinco ht. i have 3 goldwings an 81, 82 an 01. Both of the carbs are off the older bikes being worked on.

Yeah, the Alincos at least used to be the same pinouts as Icom, which is backwards from Kenwood. A Kenwood wired mic should work, though.

Thank you Dana, I saw on one of the cycle sites where someone had installed a mobile 2 meter on a goldwing and got it to work in place of the cb, but can't find the site again. I have a throat mike from radio shack but it won't fit the wouxun but will work on my alinco ht. i have 3 goldwings an 81, 82 an 01. Both of the carbs are off the older bikes being worked on.

Hello, new to the group. I just purchased this little HT for $100 thru a group purchase via local clubs banding together to purchase some radios. I spent the last day programming local area repeaters. I will attach a file with the frequencies that I programed for the Las Vegas area. I encourage you to verify my work to assure that I have not transposed a tone or frequency. Use at your own discretion.

Looking forward to learning about my HT.

Thanks for the add to the group.

I've set up my UVD1 for APRS with a KAM-4 TNC and it appears to work okay. I don't have many (probably only 1!) other stations in the vicinity, but have made 2-way contact with one station. I'm "early days" yet!

You will need to use the unlocking software to reset the transmit limits. I believe there is a copy of the program in the files section of this list. If not, search on www.mods.dk. Contact me off-list if you have any questions.

Topic: 3953 Message: 3954

That's correct and it's worth mentioning that you can not unlock to outside the limits your radio was designed for, because of filters in the receive section of the radio. Although transmit capability may be possible, the receive sensitivity falls VERY quickly outside the radio's designed range. Also after resetting the frequency limits with the unlock software, there is something in the programming software to watch out for. On the Optional Functions page, the two frequencies on the upper right should be set to your new upper limits. If they are not, you may get the "Out of Range" warning when you try to program something into memory.

A friend just brought by his UV3D to be programmed.

Nice looking front. First one I've seen. Kinda a little more beefier. Might want to wear this one with your

bib overalls. The UV1P for my jeans, and save my UV2D "Collector's Edition" for my khaki's.

I think I read this a while ago. But can you save Broadcast FM freqs using the software? Or can you save Broadcast FM freqs at all?

thanks,

Kent

Be aware that transmitting anywhere you are not licensed to transmit is illegal. Even the possession of a transmitter that can operate outside your license grade could be illegal in some places. Don't expand frequency limits just for the fun of it.

This same software can also "lock" a wide-open radio so that it will only transmit inside the ham bands.

So to program a transmit frequency outside the ham bands you must "unlock" the transmit limits. You do this with an "unlock" program. You can download a version of this program from the Files section of this very group, or from www.mods.dk.

Keep this in mind when resetting the limits of your radio. These radios WILL NOT operate outside the range they are designed for. They may transmit outside the designed range but the receive sensitivity sharply decreases outside that range. The reason for this is that there are a lot more tuned circuits, by design, in a receiver. Having it roll off above and below the designed frequency range is a good thing. It reduces IMD from other services and it's a sign of a good receiver design.

This is a stand-alone unlock program and does not need installing. Start the program and first, read from the radio. If you get a failure, click OK and read it again. It should work the second time and you will see the receive limits of the radio. Fill in these same limits* into the transmit side and "write to radio". It should be almost instantaneous.
*You can fill in lesser limits if desired, ie change only the VHF limits and leave the UHF as is.

After doing this, run the regular programming software. There is one thing that you should check before programming in your new frequencies. Check the screen named "Optional Function" (left hand column). In the upper right (next to "Current") make sure the number entered is the highest frequency in your new range. This will be 174 MHz for VHF and 470, 480 or 520 MHz for UHF, depending on your model. Write this information to the radio after you fill in the correct numbers. If you don't, you may get the "Out of Range" message when you try to enter something into memory.

3958. Unlock software for KG-UVA1

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-12-29 22:03:11 UTC
From: Matt Patterson
Topic: 3953 Message: 3958

Trying out a new KG-UVA1 and I'm having a hard time programming it. When I try to write to the radio via the programming software I get a error indicating that the frequencies I'm using are out of range. So I tried to write the ones that are stored in it back to it from the software and I get the same message. I think I need the unlock software to open this radio up. Unfortunately the unlock software that is available on this group and other places on the internet doesn't seem to work correct with this model of radio. Any help would be appreciated.

Matt

You can save a few FM broadcast stations. While
listening to the station you want to save, push and hold
one of the number keys until the radio beeps. Next time
you want to listen to that station, push that number key
(while in the FM broadcast station mode). That gives you
10 memories. That's all you get.

It is also illegal (in the USA) to even program frequencies you are not
licensed to transmit on.

See 47CFR90.427 paragraph (b)

You can't save FM broadcast stations in "regular" memories,
or using the software (which saves "regular" memories). You
can only save them from the keypad, and only when you're
in the FM broadcast mode (i.e. listening to the station you
want to save).

Unless I missed something somewhere along the line...

Actually, it is not illegal to program frequencies in our radios for which we are not licensed however, it IS illegal to program the TX frequency for that which we are not licensed. That goes for ham radio, GMRS, and other freqs too, not just Part 90 freqs.

It is also illegal (in the USA) to even program frequencies you are not
licensed to transmit on.

See 47CFR90.427 paragraph (b)
<http://ecfr.gpoaccess.gov/cgi/t/text/text-idx?c=ecfr&sid=7a9f9778c7155a1c9c461eeeaba6ef65&rgn=div8&view=text&node=47:5.0.1.1.3.13.112.12&idno=47>

So would it be not legal to unlock the radio so can transmit like on the marine bands if or when needed since the radio won't transmit now there at least on mine as it can receive there just fine?

I wasn't wanting to do anything not legal just wanted to be able to use the radio on other freqs besides the 2m or 70cm bands like mentioned.

Thanks for the steps.

Subject: [Wouxun_KG-UVD1] Re: Unlocking the radio

Be aware that transmitting anywhere you are not licensed to transmit is illegal. Even the possession of a transmitter that can operate outside your license grade could be illegal in some places. Don't expand frequency limits just for the fun of it.

This same software can also "lock" a wide-open radio so that it will only transmit inside the ham bands.

So to program a transmit frequency outside the ham bands you must "unlock" the transmit limits. You do this with an "unlock" program. You can download a version of this program from the Files section of this very group, or from www.mods.dk.

Keep this in mind when resetting the limits of your radio. These radios WILL NOT operate outside the range they are designed for. They may transmit outside the designed range but the receive sensitivity sharply decreases outside that range. The reason for this is that there are a lot more tuned circuits, by design, in a receiver. Having it roll off above and below the designed frequency range is a good thing. It reduces IMD from other services and it's a sign of a good receiver design.

This is a stand-alone unlock program and does not need installing. Start the program and first, read from the radio. If you get a failure, click OK and read it again. It should work the second time and you will see the receive limits of the radio. Fill in these same limits* into the transmit side and "write to radio". It should be almost instantaneous. *You can fill in lesser limits if desired, ie change only the VHF limits and leave the UHF as is.

After doing this, run the regular programming software. There is one thing that you should check before programming in your new frequencies. Check the screen named "Optional Function" (left hand column). In the upper right (next to "Current") make sure the number entered is the highest frequency in

your new range. This will be 174 MHz for VHF and 470, 480 or 520 MHz for UHF, depending on your model. Write this information to the radio after you fill in the correct numbers. If you don't, you may get the "Out of Range" message when you try to enter something into memory.

Ed,

I have a question. Are Wouxun_KG-UVD1 "certified for use on marine frequencies (for transmitting)? Just to keep the net police happy, here is an explanation of my use. I am part of a public service/amateur radio support group. Public service part is authorized by city OEM. We are occasionally called on to provide support for events that are marine in nature. I know that part 90 application is ok, but I am not sure of the marine radio. I would like to use one radio for amateur service, public service and marine radio.

I took a quick look and could not find a "marine radio" equivalent to part 90/97. I don't mind if you tell me where to find the regs. If you know the radios are marine "certified" that would be great to. It would be great top know the radios are legal for all three purposes. I know the radios are not waterproof. For marine service, the radio would be in a waterproof bag designed for such purposes. Almost forgot, there is a standard marine radio on the boat, so the handheld is primarily a back up and for monitoring.

I have used KG-UVD1P versions 1.15, 1.16 and currently using 2.0 and all worked on Vista Home Premium. Now I have the 1P version of the radio. I don't know if that makes a difference. Have you downloaded the Vista driver for the programming cable you are using? Available from the Wouxun site.

>

One thing to keep in mind is that Marine VHF is not Part 90 (or 97), its Part 80 (different certification) and the International Distress and Emergency shipboard frequency (156.800 - CH 16) is probably not the best place to test, since all boats and shore stations are supposed to be listening on that frequency for distress calls.

George,

Your UVD1P is perfectly legal for marine use. Just be aware not to do any testing on Ch 16 and it is not usually appropriate for land use. I am an ex-boater and can't recall the exact rules now but I had a permanent mount in my boat and had a handheld too but it was not legal to communicate with the family on shore from my boat. Might be different now. It's been so long I won't begin to quote law or rules. I'll leave that up to FCC searches by you.

There really is no certification specitic to marine applications. If it is certified for Part 90 then you will be okay.

Thanks Bob. I stand corrected. Like I said, it's been a long time.
I really don't deal with marine anymore since I sold the boat and no longer live near the coast. Actually, quite the contrary; I live in the desert of SoCal.

Sorry George, Bob's right. Please refer to section 80.203 of the FCC rules. Use Bob's link. It's on page 47.

Actually, it is not illegal to program frequencies in our radios for which we are not licensed however, it IS illegal to program the TX frequency for that which we are not licensed. That goes for ham radio, GMRS, and other freqs too, not just Part 90 freqs.

Does anyone else have one of these radios? I have one to demo and I'm having problems getting the radio to accept my frequencies. Yes, they are within the range that this radio covers. The software that was uncluded with the radio is for the KG-UVD1P and it will read the frequencies in the radio but when you try to write to the radio I get a out of range message. I get the same error message when I read the current stored frequencies and then try to write the same ones back to it without changing anything. I tried the Unlock software and it reads all 9999s in every blank. So it would seem either this radio is somehow locked or that the software doesn't work for this model. I'm hoping that maybe someone else on this forum has one of these radios and has run into this problem before. I really don't feel like trying to talk to Chinese tech support.

My thanks to both of you for your time and efforts! It looks like the proper way to go is monitoring only and using the boat marine radio for transmission. I still need to rread thoroughly as I want to better understand the marine handheld coverage. The most significant issue for me is the part 90/97 certification.

Happy New Year to all!

George

Thanks Bob. I stand corrected. Like I said, it's been a long time.
I really don't deal with marine anymore since I sold the boat and no longer live near the coast. Actually, quite the contrary; I live in the desert of SoCal.

Sorry George, Bob's right. Please refer to section 80.203 of the FCC rules. Use Bob's link. It's on page 47.

Sorry but I have to disagree, marine radio is covered under Part 80 of the FCC rules.
http://www.gpo.gov/fdsys/pkg/CFR-2009-title47-vol5/pdf/CFR-2009-title47-vol5-part80.pdf

On 12/29/2010 10:30 PM, Ed Greany wrote:
George,

Your UVD1P is perfectly legal for marine use. Just be aware not to do any testing on Ch 16 and it is not usually appropriate for land use. I am an ex-boater and can't recall the exact rules now but I had a permanent mount in my boat and had a handheld too but it was not legal to communicate with the family on shore from my boat. Might be different now. It's been so long I won't begin to quote law or rules. I'll leave that up to FCC searches by you.

There really is no certification specitic to marine applications. If it is certified for Part 90 then you will be okay.

□
Ed,

I have a question. Are Wouxun_KG-UVD1 "certified for use on marine frequencies (for transmitting)? Just to keep the net police happy, here is an explanation of my use. I am part of a public service/amateur radio support group. Public service part is authorized by city OEM. We are occasionally called on to provide support for events that are marine in nature. I know that part 90 application is ok, but I am not sure of the marine radio. I would like to use one radio for amateur service, public service and marine radio.

I took a quick look and could not find a "marine radio" equivalent to part 90/97. I don't mind if you tell me where to find the regs. If you know the radios are marine "certified" that would be great to. It would be great top know the radios are legal for all three purposes. I know the radios are not waterproof. For marine service, the radio would be in a waterproof bag designed for such purposes. Almost forgot, there is a standard marine radio on the boat, so the handheld is primarily a back up and for monitoring.

We have the same sort of thing in the UK with OFCOM (Office of Communications) - our version of the FCC. BUT if law enforcement happen to take an interest in ones possession of a transceiver, they might give OFCOM a call to come and investigate, from then on things can become interesting :-(

Hi, we have similar rules in NZ too. BUT, they have to PROVE you were transmitting on a certain frequency before they can touch you. I have all sorts of freqs. in my radios and would use them ONLY in an EMERGENCY when all other regular frequencies are dead or nobody answers - which in the case of HAM radio would be rare (an emergency call on a HAM freq. will generally raise somebody if there is a repeater available etc.)

You missed the top line: "Land Mobile Radio Services", a.k.a.
"business band". Nothing to do with Marine frequencies, etc.
If your assertion was true, then HF rigs could only be sold to
Extra class hams because they're the only class licensed to
transmit on all amateur frequencies. Also, that would make
all MARS modded radios illegal, and they're not. Your thoughts
make sense for a business band radio (a.k.a. Land Mobile Radio
Service), but not for other services, where a radio is likely to be
used to mitigate an emergency. (In a life-or-death emergency, it's
legal to transmit on ANY frequency.)

Hokay, I just programmed it with the software, how do I get it to display in channel numbers or names? when I go by the book I can't get it in working mode. Step 21, menu-2-1 menu-press up or down to select parameters menu-exit. and I can't get the xmit ctcss to turn on.

Thanks,

Mark KE5JNS

None of the software will work on my windows vista, the driver download
won't install, but I switched it to my laptop with xp and everything works
fine on it.

Ed, any more on the mobile?

Thanks, 73's and happy new year

I've got the Wouxun channel programming software running on four computers, two running Windows 7, one on Vista and a very old laptop on XP. Only the XP machine works properly. The others won't save the .tw files and only the XP machine prints out the channel list correctly.

Have had a UVD1P for a few days now and run everything on a notebook
running Windows 7, the programming software runs no problem and prints
out correctly - if I select 'landscape' orientation :-)

I bought a new Dell Optiplex 960 in the Spring and it came with Windows 7 CD but it had Windows XP installed. Tihs should tell you something about the newer operating systems! I have a Sony Laptop with the radio, it has Vista on it and it works fine with Ham Radio Deluxe, so I am leaving it alone.

Your problem is likely the USB/Serial drivers. They are tricky on XP, trickier on Vista. Since you can't get either program to work, that's what it sounds like.

> Does anyone else have one of these radios? I have one to demo and I'm having problems getting the radio to accept my frequencies. Yes, they are within the range that this radio covers. The software that was uncluded with the radio is for the KG-UVD1P and it will read the frequencies in the radio but when you try to write to the radio I get a out of range message. I get the same error message when I read the current stored frequencies and then try to write the same ones back to it without changing anything. I tried the Unlock software and it reads all 9999s in every blank. So it would seem either this radio is somehow locked or that the software doesn't work for this model. I'm hoping that maybe someone else on this forum has one of these radios and has run into this problem before. I really don't feel like trying to talk to Chinese tech support.

Having purchased a KG-UVD1P I note that the charger has an AC input* of 100-240v via a plug-in figure of '8' mains lead. The charger photos that I have seen show a separate Wall Wart with a low voltage output to the charger.. Are Wouxun now supplying a different charger with newer radios??

* There is also a 12vDC input connection..

Hi Mike -

Yes, you're right, "portrait" is a disaster - it chops off columns 1, 2 & 10 of the data. But even with "Landscape" I find that Windows 7 and Vista only print out TWO pages ie channels 1 to 88 - the third page (channels 89 to 128) does not print..... The XP machine, using the same printer, produces all three pages.

Hi Brian, with Windows 7 it prints 4 pages!! Page 1 channels 1-47, Page 2 channels 48-94, Page 3 channels 95-128 and page 4 a list of optional function settings and key settings..
At the moment I only have one PC so I cannot try any other OS..

4006. Wouxun Connection Failed - Solved

Yahoo group: Wouxun_Radios (2009 — 2010)
Date: 2010-12-31 16:21:20 UTC
From: kd5oug
Topic: 4006 Message: 4006

I had trouble programing a KG-UVD1P1 but I finally got it figured out.

The problem I was having was when I tried to program the radio using the Wouxun USB programming cable and the Wouxun KG-UVD1P1.16 programming software, I kept getting the "Failed Connection" message. This was with both Vista Home and XP Home SP3.

The issue was with the Comm Ports. They weren't matching. My computers only have USB ports - no serial ports. In diagnosing the problem, I ended up removing all USB cards from the computer then connecting the Wouxun USB cable with the radio attached and turned on. That way I could be sure what Comm port was being assigned.

I used the driver from Wouxun for my operating systems. The Prolific-USB-to-Serial Comm Port driver was on Comm 6 on my computers. The programming software was looking for Comm 1. To resolve the difference, I reset the Comm port assigned to the Prolific drive.

To reset that port I went to Control Panel>Device Manager>Ports(Comm & LPT). I double clicked on the Prolific port assigned to open Properties. Then Port Settings>Advanced. There I reset the port to Comm 1. That's what Wouxun was looking for. I then rebooted the computer.

Here's the programming sequence that I found works on both operating systems.

1. Turn ON the computer.

2. With the USB cable unplugged from the computer, plug the cable into the radio firmly.

3. Turn ON the radio.

4. Plug the USB cable into the computer. At this point the computer should beep or indicate that a USB was plugged in.

5. Run the KG-UVD1P1.16.exe programming software.

6. At the top of the program window , verify that the program is selecting Comm Port 1.

7. Now the software can read and write to the radio.

Both of ours (bought 3 months and 8 months ago) have the mains cord moulded in and a UK mains plug fitted, as well as a 12v socket (I bought the cigar-lighter adapter too so we can charge "on the road", though that's not so good while moving as the is no place in the car to stand them to be able to see the displays). For mobile operation it would have been wise to have bought the "12v adapter" that takes the place of the battery pack - but we've never run a battery flat while mobile anyway ;-)

So that is THREE versions of the charger:
1) Supplied by 12v wall wart
2) Supplied by 100-240vAC hard wired
3) supplied by 100-240vAC socketed
All with 12vDC mobile option..

SInce the regulation circuitry for consumer Li-Ion packs is built into each battery pack, all that is "standard" for a charger is some sort of holder/tray and something to get 7.2 - to - 12VDC to that tray's battery contacts.

I'm not sure of your point unless you saw "standard" somewhere.
There are however, two different charger bases. I have both and prefer the single one over the 2-battery charger base. The base is simply that - a base. No wire or cord attached. The A/C cord is included but plugs into the back of the base with a plug similar to some electronics or older radios. Fits nice and I like the fact it is removable. There is also available as an option a D/C cord so you can use the same base in the mobile to charge your batteries from the 12v port or cigarette lighter port.
Does that help or did I completely miss your point?

Ed

No Ed,

Mine came (from China) with the UK-plugged mains cable permanently attached to the base.

Not that it really matters!

Stu

Ah, I should read ALL my mail before responding.
WELCOME ABOARD Clint, K6LCS.
I didn't realize you were on the board and thought you had written me offline thus my prior response. Now that I read ALL my mail I can follow the thread.
Sorry for the confusion on MY part.

73

Happy New Year everyone. I hope you are all enjoying your new toys (dual-band units).

Ed, KB6DOL / KAD6554

None of the software will work on my windows vista, the driver download won't install, but I switched it to my laptop with xp and everything works fine on it.

Ed, any more on the mobile?

Thanks, 73's and happy new year

There are three different types of charger. I've had two of them.
